Baldwin Park, California 91706

Subject: **April 2025 Monthly Report Pursuant to Milestones 1A-3 and 5 of the LEA June 6, 2024 Compliance Order and July 30, 2024 Letter, Chiquita Canyon Landfill, Castaic, California**

Dear Ms. Gork:

SCS Engineers (SCS), on behalf of Chiquita Canyon, LLC (Chiquita), hereby provides the Los Angeles County Department of Public Health, Solid Waste Management Program, acting as the Local Enforcement Agency (LEA) with a monthly report pursuant to Milestones 1A-3 and 5 of the LEA Compliance Order dated June 6, 2024 (Compliance Order) and subsequent related correspondence received from the LEA. This report covers the monthly period for April 2025.

Chiquita Canyon Landfill (CCL or Landfill) is a landfill/solid waste disposal facility located at 29201 Henry Mayo Drive in Castaic, California. In connection with the Landfill, Chiquita operates a landfill gas collection and control system. SCS prepared and submitted the Carbon Monoxide and Hydrogen Reading Summary Report (Summary Report) to the LEA on June 6, 2024, on behalf of Chiquita, in response to the directives in the LEA letters dated April 5, 2024 and May 28, 2024 regarding collection of landfill gas data and in accordance with Milestone 1A-2 of the Compliance Order. The LEA, in collaboration with the California Department of Resources, Recycling, and Recovery (CalRecycle), reviewed the Summary Report and determined that it complied with Milestone 1A-2. The LEA set forth several new requirements for Chiquita to comply with Milestone 1A-3 in follow-up correspondence dated July 30, 2024.

This report was prepared in accordance with Milestones 1A-3 and 5 of the Compliance Order, the LEA's follow-up correspondence dated July 30, 2024, Chiquita's letter dated September 3, 2024, the September 12, 2024 meeting with the LEA, and follow-up correspondence from the LEA dated November 19 and 27 and December 3, 2024.

Milestone 1A-3 Compliance Items

1. Submit the laboratory test results for monthly sampling of carbon monoxide (CO) and hydrogen (H2) from a set of landfill gas (LFG) wells selected by the LEA. Please see Table 1, columns labeled "CO" and "H2."

Results for wells monitored are shown in **Attachment A.**[1] The data is being submitted to the LEA in a standalone report signed by a licensed engineer, in accordance with Milestone 1A-3 of the Compliance Order. As noted in Chiquita's prior correspondence and monthly reports, this report does not include data from wells CV-100, CV-1420, CV-1532, CV-2202, H-1774S, TC-2385A, and TC-2385S, as those wells have been abandoned, or from well CV-2332, as that well was never installed. All remaining wells were tested during the month of April 2025.

As discussed during the September 12, 2024 meeting, and as previously reported, graphics showing CO and H2 trends are provided in **Attachment D** and are discussed further below.

2. Provide data from readings for fixed gases (CH4, O2, and CO2) from a set of LFG wells selected by the LEA. See Table 1, column labeled "Fixed Gas CH4, O2, CO2."

The results for wells monitored are provided in **Attachment A**.

3. Collect down well temperatures at 34 wells to confirm the gas wellhead temperature readings per the requirement of the New Source Performance Standards (NSPS). See Table 1, column labeled "Down Well Temp Monitoring."

It is Chiquita's understanding from the LEA's November 27, 2024 correspondence, and as noted in prior monthly reports, that, at this time, Chiquita is only required to sample the wells at the annual frequency provided in the NSPS protocols, but that the LEA may require more frequent monitoring for up to ten (10) wells selected by the LEA. Chiquita is awaiting the LEA's selection of those wells.

Chiquita nevertheless provides in **Attachment B** the down-hole temperature graphs concerning the following wells from fixed locations which contain the Lorentz Pumping System with integral temperature sensors: CV-2301, CV-2302, CV-2303, CV-2315, CV-2350, CV-2351 and CV-24017.

Additionally, a new pump and telemetry system was installed at well CV-24065, so that graph is now included in this report.

[1] The lab(s) reported data from additional LFG wells outside of those selected for sampling by the LEA; the additional data is related to separate South Coast Air Quality Management District (South Coast AQMD) reporting requirements and therefore can be disregarded for purposes of this report.

Please note that the Lorentz systems for pumps CV-2350 (data is available through April 15, 2025), CV-2352, and CV-24095 are currently offline and awaiting parts which are currently not available.

As previously noted, SCS will continue to collect down-hole temperatures for wells on an annual basis and will report the results as the data is obtained at each location. SCS performed annual down-hole temperature monitoring at 28 locations during March 2025, as reported in the last monthly report. During April 2025, SCS performed repeat down-hole temperature monitoring at the following location for the 2025 annual monitoring: CV-24138 (see **Attachment B** for dates of annual monitoring).

Note that the telemetry system at well CV-2350 was only online from April 1 through 15. This location is on the list to be repaired upon delivery of the additional parts.

Two locations remain for annual down-hole monitoring as of the end of April 2025: CV-2002 and CV-2353. These locations are expected to be monitored during the second quarter of 2025, safety permitting.

4. Sample the selected 40 wells for VOCs by method TO-15. See Table 1, column labeled "VOC (TO-15)."

The results for wells monitored are provided in **Attachment A**.[2]

5. Continue to sample and monitor 6 horizontal wells as indicated in Attachment 1, well numbers highlighted in yellow. At this time, 42 horizontal wells may be released from continued sampling, however, wells may be included later depending on future data submissions. See Table 1, well numbers highlighted in blue.

As noted in the September 3 letter and reported in prior monthly reports, two (2) of the six (6) horizontal wells (H-1774S and H-1560S) were abandoned when the new vertical extraction wells were installed, and thus data from those wells are not included. Data from the four (4) other horizontal wells are in **Attachment A**.

6. Add 20 vertical wells to the monthly wellhead temperature and LFG sampling protocols. See Table 1 well numbers highlighted in green.

As conveyed by the LEA during our September 12, 2024 meeting, and restated in our prior monthly reports, we understand the LEA is requiring laboratory analytical data for fixed gases, CO, and H2, as well as field data. Laboratory results are in **Attachment A**. Field data with wellhead gas temperatures are shown on Table 2 in **Attachment A**.

We understand from the LEA's November 27, 2024 correspondence that laboratory analytical

[2] Well CV-24142 is listed twice in Table 1 of the LEA's July 30 letter – one requires VOC sampling, and the other does not. Chiquita sampled this well for VOCs.

data will be required for the specified fixed gases.

Note that following wells were again not sampled in April 2025, for the following reasons noted in prior monthly reports:

CV-1420 – Abandoned during 2024 GCCS Expansion due to declining gas flows.
CV-2202 – Abandoned during 2024 GCCS Expansion due to declining gas flows.
CV-2332 – This well does not exist. This well was proposed for installation in Fall 2023, but other wells were installed in the area in lieu of CV-2332 when the number of wells increased pursuant to the Stipulated Order for Abatement (Stipulated Order) with the South Coast AQMD.

7. Plot to show the locations of the following 19 wells on the site map titled "Existing GCCS Map – LFG Vertical Extraction Wells" dated 06/06/2024: CV-24002, CV-24003, CV-24007, CV-24017, CV-24053, CV-24055, CV-24065, CV-24071, CV-24075, CV-24077, CV-24079, CV-24082, CV-24083, CV-24088, CV-24095, CV-24096, CV-24097, CV-24098 and H-1403W. For well H-1403W, provide the horizontal location of piping and an estimate where the high temperature (195°F) is most likely occurring. See Table 1, well numbers highlighted in red and H-1403W (highlighted in yellow).

The locations of the above-identified wells are shown on the Map in **Attachment C**.[3]

8. Include in the monthly report, a settlement/heat map as shown below, beginning with the earliest heat map data available for each month to present. The topographic maps should show 2-foot contour intervals if possible.

The LEA clarified in its correspondence dated November 27 and December 3, 2024 that in lieu of this request, Chiquita could submit quarterly maps together with its monthly fissures and tension cracks summaries, which are submitted on the second Tuesday of each month. Chiquita has been submitting quarterly isopach maps to the LEA in accordance with this direction. For ease of reference, we have submitted copies of these maps in our prior monthly reports, and we are resubmitting a copy of the most recent First Quarter 2025 isopach map (covering the period between January 3, 2025 and April 2, 2025) with this report as **Attachment F**. This map was also included in the last monthly report.

9. Provide the sampling results in a standalone report with the appropriate discussion, tables, QA/QC, methods and signed by a registered professional, etc., as described in the Compliance Order Milestone 1A-2 and 1A-3.

CCL has provided the above-requested information and the raw data in **Attachment A**, as well as a figure with the data-driven reaction area which incorporates settlement data (see

[3] The LEA acknowledged in its November 20, 2024 correspondence that a high temperature is not occurring in well H-1403W. We therefore did not map the maximum temperature at well H-1403W.

Attachment F). Graphs are provided for wells with Lorentz pumps (8 locations – including the one new location, well CV-24065). The remaining two (2) wells, CV-2002 and CV-2353, will be tested during the second quarter of 2025 if the LFG temperature measurements require annual monitoring and they are safe to access.

Please note that in addition to the wells listed in response to request dated July 30, 2024 in Table 1 that could not be tested, the following wells that only required analytical data could also not be tested, as previously reported, because they were abandoned during the 2024 GCCS expansion due to declining gas flows in accordance with the requirements of the NSPS: CV-100, CV-1532, H-1560S, H-1774S, TC-2385A, TC-2385S, CV-2202, and CV-1420. Finally, as also previously reported, CV-2332 was never installed.

Sampling Procedures

Gas samples were collected using Tedlar/Mylar bags, as described in Chiquita's September 3, 2024 letter and the prior monthly reports, and then delivered to certified laboratories for testing. All permanent gas (CH4, CO2, O2, N2, CO, and H2) data were analyzed within the requested 24 hours of sampling in compliance with standard lab practices. SCS continues to believe that use of the EPA-approved 72-hour holding time for these samples would be appropriate and accurate. Nevertheless, in response to the LEA's March 17, 2025 correspondence, SCS will continue to request 24-hour holding times for all fixed gases, including CO, H2, and VOCs, collected using Tedlar bags. With assistance from the laboratories, the logistics to maintain a 24-hour analytical time are currently in place. However, if additional sampling is required or if the laboratories have a change in workload, this holding time may change, in which case the LEA will be notified accordingly.

Additional gas and pressure data were collected using either an Envision Irwin Gas Meter or Landtec GEM 5000 Gas monitoring device. These instruments measure combustible gas concentrations in air directly on either of two scales, the first as a percent by volume of the lower explosive limit (LEL) of methane gas in air (0 to 5 percent) and the other as a percent by volume (0 to 100 percent) in the gas sampled. The detection limit for these instruments is approximately 0.10 percent by volume.

Gas monitoring testing procedures were as follows:

- Connect sample tubing, open test valve, observe pressure, and record data.
- Turn on sample pump, purge a minimum of one probe volume, and observe and record methane, oxygen, and carbon dioxide gas concentrations when readings have stabilized.
- Close test valve, disconnect sample instruments, and secure sample location.

Milestone 1A-3 Conclusions

April 2025 was the ninth monitoring performed pursuant to Milestone 1A-3 of the Compliance Order. The data collected in April 2025 and evaluated for this report is consistent with the data collected in the previous months of August 2024 through March 2025 as well as the data collected and evaluated by the Reaction Committee established by the Stipulated Order to assess the reaction area, including the April 2025 data most recently evaluated by the Reaction Committee on May 10, 2025. *See* **Attachment E**.

For the reasons described in the attached May Reaction Committee report, the alignment of the estimated extent of the elevated temperature landfill (ETLF) conditions exhibited at the Landfill (referred to as the "Reaction Area" limits) remains the same. The Reaction Committee determined that no adjustments were warranted and that ETLF conditions have not expanded. There was no evidence of reaction conditions or reaction gas present outside of the currently delineated reaction area boundary.

As liquid levels continue to change due to the installation of additional Lorentz Electric and Pneumatic Pumps, we are seeing the anticipated changes in percentages of Permanent Gases, Carbon Monoxide, and Hydrogen and changes to temperatures as more gas is able to be extracted and move to extraction wells as the levels of liquid decline. This continues to be demonstrated by the multiscale well graphics included in **Attachment D**, which includes graphics on permanent gases, temperature, and other trends over a six (6)-month period. Note that these graphs were created using standard landfill gas monitoring equipment results and do not contain laboratory data. SCS has also included the Hydrogen and Carbon Monoxide graphs using laboratory results for your use and review.

Additionally, the installation of larger diameter piping has improved the collection of additional gases throughout the Landfill. Since March 2025, the flow rates of landfill gas being combusted by the abatement devices have increased from 13,500 cfm to 15,000 cfm. Please note that during April 2025, the overall gas extraction from the Landfill increased from 592,385,006 to 616,377,600 cubic feet. This increase and anticipated future increases are expected to improve the gas composition of the wells in the reaction area as more vacuum and resulting movement of gas allows more reaction gas to be extracted.

Chiquita will continue to evaluate the data in future monthly reports as additional data is collected.

Milestone 5 Compliance Items

This report includes in **Attachment D** individual maps overlayed with the following data for April 2025 in an easily understood format, in accordance with Milestone 5 of the Compliance Order:

- Defined reaction area;
- Expansion of reaction area, if any;
- Weekly TMP data; and
- LFG data including, but not limited to, CH4, CO2, O2, Temperature, CO, and H2 data.

Milestone 5 also requires "settlement with heat maps," but as discussed earlier in this report and in accordance with LEA correspondence dated November 27 and December 3, 2024, this requirement was satisfied by Chiquita's submittal of its First Quarter 2025 isopach map to the LEA on April 8, 2025. For the LEA's convenience, this map was included in the last monthly report and is included again herein as **Attachment F**.

LABORATORY TEST RESULTS

Project Reference: Chiquita Canyon Landfill
Project Number: 07224200.24 Task 1
Lab Number: S040105-01/10

Enclosed are the results for sample(s) received 4/01/25 by Air Technology Laboratories. Samples were received intact. Analyses were performed according to specifications on the chain of custody provided with the sample(s).

Report Narrative:

- Modifications to EPA Method TO-15 – Samples collected in Mylar bags. Quadratic regression calibration was required for bromoform and 1,2,4-trichlorobenzene.
- Ethyl acetate exhibited high recovery in the initial calibration verification indicating a possible high bias. Results are flagged with the Q qualifier.
- Benzyl Chloride exhibited low recovery in the continuing calibration verification indicating a possible low bias. Results are flagged with the Q qualifier.
- Unless otherwise noted in the report, sample analyses were performed within method performance criteria and meet all requirements of the TNI Standards.
- The enclosed results relate only to the sample(s).

Preliminary results were e-mailed to Cornelius Fong, Jenny Kim and Ali Ferrara on 4/16/25.

ATL appreciates the opportunity to provide testing services to your company. If you have any questions regarding these results, please call me at (626) 964-4032.

Sincerely,

Mark Johnson

LABORATORY TEST RESULTS

Project Reference: Chiquita Canyon Landfill
Project Number: 07224200.24 Task 1
Lab Number: S040205-01/10

Enclosed are the results for sample(s) received 4/02/25 by Air Technology Laboratories. Samples were received intact. Analyses were performed according to specifications on the chain of custody provided with the sample(s).

Report Narrative:

- Modifications to EPA Method TO-15 – Samples collected in Mylar bags. Quadratic regression calibration was required for bromoform and 1,2,4-trichlorobenzene.
- Ethyl acetate exhibited high recovery in the initial calibration verification indicating a possible high bias. Results are flagged with the Q qualifier.
- Benzyl chloride exhibited low recovery in the continuing calibration verification indicating a possible low bias. Results are flagged with the Q qualifier.
- Unless otherwise noted in the report, sample analyses were performed within method performance criteria and meet all requirements of the TNI Standards.
- The enclosed results relate only to the sample(s).

Preliminary results were e-mailed to Cornelius Fong, Jenny Kim and Ali Ferrara on 4/17/25.

ATL appreciates the opportunity to provide testing services to your company. If you have any questions regarding these results, please call me at (626) 964-4032.

Sincerely,

Mark Johnson

LABORATORY TEST RESULTS

Project Reference: Chiquita Canyon Landfill
Project Number: 07224200.24 Task 1
Lab Number: S040303-01/10

Enclosed are the results for sample(s) received 4/03/25 by Air Technology Laboratories. Samples were received intact. Analyses were performed according to specifications on the chain of custody provided with the sample(s).

Report Narrative:

- Modifications to EPA Method TO-15 – Samples collected in Mylar bags. Quadratic regression calibration was required for bromoform and 1,2,4-trichlorobenzene.
- Ethyl acetate exhibited high recovery in the initial calibration verification indicating a possible high bias. Results are flagged with the Q qualifier.
- Benzyl chloride exhibited low recovery in the continuing calibration verification indicating a possible low bias. Results are flagged with the Q qualifier.
- Unless otherwise noted in the report, sample analyses were performed within method performance criteria and meet all requirements of the TNI Standards.
- The enclosed results relate only to the sample(s).

Preliminary results were e-mailed to Cornelius Fong, Jenny Kim and Ali Ferrara on 4/18/25.

ATL appreciates the opportunity to provide testing services to your company. If you have any questions regarding these results, please call me at (626) 964-4032.

Sincerely,

Monika Sotelo Sanchez

LABORATORY TEST RESULTS

Project Reference: Chiquita Canyon Landfill
Project Number: 07224200.24 Task 1
Lab Number: S040702-01/10

Enclosed are the results for sample(s) received 4/07/25 by Air Technology Laboratories. Samples were received intact. Analyses were performed according to specifications on the chain of custody provided with the sample(s).

Report Narrative:

- Modifications to EPA Method TO-15 – Samples collected in Mylar bags. Quadratic regression calibration was required for acetone, benzyl chloride and 1,2,4-trichlorobenzene.
- Ethyl acetate exhibited high recovery in the initial calibration verification indicating a possible high bias. Results are flagged with the Q qualifier.
- Benzyl chloride exhibited low recovery in the continuing calibration verification indicating a possible low bias. Results are flagged with the Q qualifier.
- Unless otherwise noted in the report, sample analyses were performed within method performance criteria and meet all requirements of the TNI Standards.
- The enclosed results relate only to the sample(s).

Preliminary results were e-mailed to Cornelius Fong, Jenny Kim and Ali Ferrara on 4/22/25.

ATL appreciates the opportunity to provide testing services to your company. If you have any questions regarding these results, please call me at (626) 964-4032.

Sincerely,

Mark Johnson
Operations Manager

LABORATORY TEST RESULTS

Project Reference: Chiquita Canyon Landfill
Project Number: 07224200.24 Task 1
Lab Number: S040803-01/10

Enclosed are the results for sample(s) received 4/08/25 by Air Technology Laboratories. Samples were received intact. Analyses were performed according to specifications on the chain of custody provided with the sample(s).

Report Narrative:

- Modifications to EPA Method TO-15 – Samples collected in Mylar bags. Quadratic regression calibration was required for acetone, benzyl chloride and 1,2,4-trichlorobenzene.
- Ethyl acetate exhibited high recovery in the initial calibration verification indicating a possible high bias. Results are flagged with the Q qualifier.
- Benzyl chloride exhibited low recovery in the continuing calibration verification indicating a possible low bias. Results are flagged with the Q qualifier.
- Unless otherwise noted in the report, sample analyses were performed within method performance criteria and meet all requirements of the TNI Standards.
- The enclosed results relate only to the sample(s).

Preliminary results were e-mailed to Cornelius Fong, Jenny Kim and Ali Ferrara on 4/23/25.

ATL appreciates the opportunity to provide testing services to your company. If you have any questions regarding these results, please call me at (626) 964-4032.

Sincerely,

Mark Johnson

LABORATORY TEST RESULTS

Project Reference: Chiquita Canyon Landfill
Project Number: 07224200.24 Task 1
Lab Number: S040902-01/10

Enclosed are the results for sample(s) received 4/09/25 by Air Technology Laboratories. Samples were received intact. Analyses were performed according to specifications on the chain of custody provided with the sample(s).

Report Narrative:

- Modifications to EPA Method TO-15 – Samples collected in Mylar bags. Quadratic regression calibration was required for acetone, benzyl chloride and 1,2,4-trichlorobenzene.
- Ethyl acetate exhibited high recovery in the initial calibration verification indicating a possible high bias. Results are flagged with the Q qualifier.
- Benzyl chloride exhibited low recovery in the continuing calibration verification indicating a possible low bias. Results are flagged with the Q qualifier.
- Unless otherwise noted in the report, sample analyses were performed within method performance criteria and meet all requirements of the TNI Standards.
- The enclosed results relate only to the sample(s).

Preliminary results were e-mailed to Cornelius Fong, Jenny Kim and Ali Ferrara on 4/23/25.

ATL appreciates the opportunity to provide testing services to your company. If you have any questions regarding these results, please call me at (626) 964-4032.

Sincerely,

Mark Johnson
Operations Manager

LABORATORY TEST RESULTS

Project Reference: Chiquita Canyon Landfill
Project Number: 07224200.24 Task 1
Lab Number: S041008-01/10

Enclosed are the results for sample(s) received 4/10/25 by Air Technology Laboratories. Samples were received intact. Analyses were performed according to specifications on the chain of custody provided with the sample(s).

Report Narrative:

- Modifications to EPA Method TO-15 – Samples collected in Mylar bags. Quadratic regression calibration was required for bromoform and 1,2,4-trichlorobenzene.
- Ethyl acetate exhibited high recovery in the initial calibration verification indicating a possible high bias. Results are flagged with the Q qualifier.
- Unless otherwise noted in the report, sample analyses were performed within method performance criteria and meet all requirements of the TNI Standards.
- The enclosed results relate only to the sample(s).

Preliminary results were e-mailed to Cornelius Fong, Jenny Kim and Ali Ferrara on 4/25/25.

ATL appreciates the opportunity to provide testing services to your company. If you have any questions regarding these results, please call me at (626) 964-4032.

Sincerely,

Mark Johnson

LABORATORY TEST RESULTS

Project Reference: Chiquita Canyon Landfill
Project Number: 07224200.24 Task 1
Lab Number: S041405-01/06

Enclosed are the results for sample(s) received 4/14/25 by Air Technology Laboratories. Samples were received intact. Analyses were performed according to specifications on the chain of custody provided with the sample(s).

Report Narrative:

- Modifications to EPA Method TO-15 – Samples collected in Mylar bags. Quadratic regression calibration was required for acetone, benzyl chloride, and 1,2,4-trichlorobenzene.
- Unless otherwise noted in the report, sample analyses were performed within method performance criteria and meet all requirements of the TNI Standards.
- The enclosed results relate only to the sample(s).

Preliminary results were e-mailed to Cornelius Fong, Jenny Kim and Ali Ferrara on 4/28/25.

ATL appreciates the opportunity to provide testing services to your company. If you have any questions regarding these results, please call me at (626) 964-4032.

Sincerely,

Mark Johnson
Operations Manager

150 75 0 150 300 150

SCALE: 1"=150'

LEGEND

- 1150 — TOPOGRAPHIC CONTOUR
- EXISTING CELL LIMITS (APPROXIMATE)
- CV-XX — EXISTING VERTICAL LFG EXTRACTION WELL
- H-XX — EXISTING HORIZONTAL COLLECTOR
- EXISTING HORIZONTAL COLLECTOR PERFORATED PIPE
- REACTION AREA BOUNDARY (APPROXIMATE) - BASED ON DATA REVIEW
- REACTION AREA BOUNDARY - CONDITION 9A

GENERAL DRAWING NOTES:

1. EXISTING TOPOGRAPHIC SURVEY INFORMATION SHOWN WAS PROVIDED BY BLUE RIDGE SERVICES. AERIAL PHOTOGRAPHY DATED AUGUST 28, 2024.
2. NORTH ARROW SHOWN HERE IS REFERENCE TO THE CALIFORNIA STATE PLANE ZONE V COORDINATE SYSTEM, NAD 83.
3. THE LOCATION OF ANY EXISTING GCCS COMPONENTS AND OTHER FEATURES ARE APPROXIMATE AND SHOULD BE USED FOR INFORMATION PURPOSES ONLY. ACTUAL FIELD CONDITIONS MAY VARY AND SUBJECT TO CHANGE BASED ON FUTURE FILL OPERATIONS, WASTE PLACEMENT, TOPOGRAPHIC FEATURES, AND OTHER SITE-SPECIFIC FACTORS.

Solid Waste Borehole Maximum Temperature Profiles Over 6 Weeks

for 2/20/2025 to 4/2/2025

From March 27, 2025, through April 2, 2025, there were two recorded temperature increases and one temperature decrease that triggered the notification limits set forth in the LEA's October 4, 2024 letter. Both increases and the decrease appear to be issues with the thermocouple or data head and are being evaluated as possible anomaly/outlier data.

Additionally, as of February 7, 2025, eight new TMPs (TMP-25, TMP-26, TMP-27, TMP-29, TMP-30, TMP-31, TMP-32, and TMP-34) have been installed and are online. None of these eight new TMPs indicate reaction temperatures occurring outside of the currently delineated data-driven reaction area boundary, and the three TMPs that were able to be drilled to within 20 feet of the liner (TMP-27, TMP-31, and TMP-32) show significantly cooler temperatures at the deepest thermocouple, as expected due to the cooling from the underlying earth. This data further supports the previous conclusions of cooler temperatures near the liner and the liner's integrity being uncompromised by elevated temperatures.

Chiquita provides the following updates:

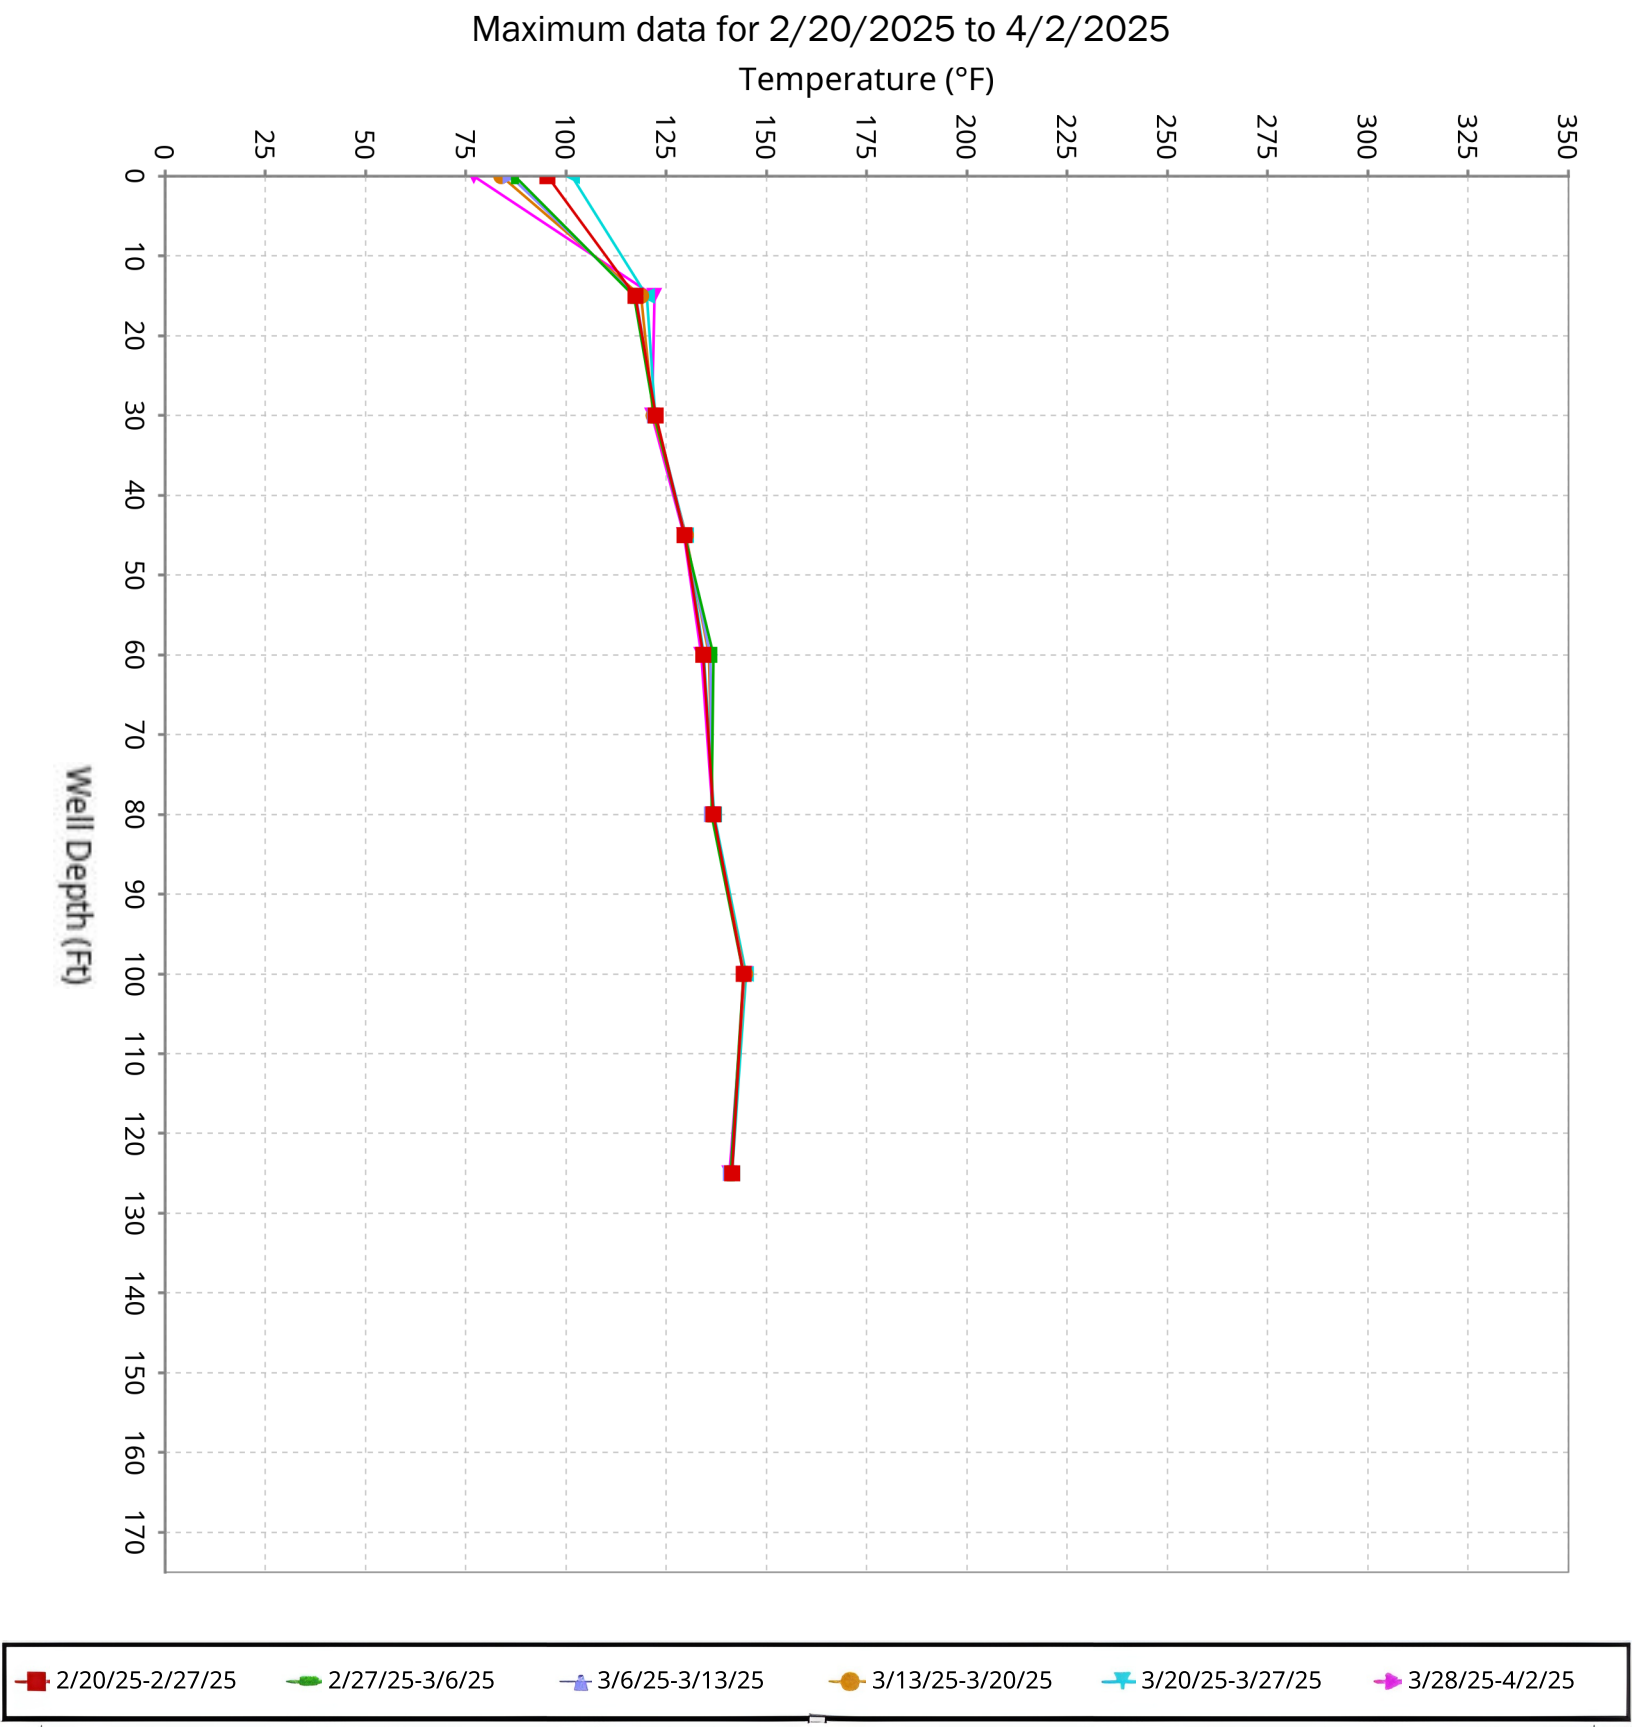

- TP-04
  - 30-foot thermocouple showed an increase in maximum temperature of 33°F from 167°F to 200°F from March 26th to March 27th, then an increase in maximum temperature of 33°F from 200°F to 233°F from March 27th to March 28th, and then a decrease in maximum temperature of 60°F from 233°F to 173°F from March 28th to March 30th. No other thermocouples of TP-04 showed a change of temperature during this time and we believe the thermocouple is beginning to fail. The 30-foot thermocouple was taken offline on April 2nd for testing and diagnostics to determine if the temperatures are in error or the thermocouple is falling.
- TP-06
  - During field investigation of TP-06, the thermocouples were evaluated and found to have had errors and failures since being brought back online from filling operations. The failed sensors are in the process of being replaced and new and corrected temperatures will be included in next week's submittal.

Solid Waste Borehole Maximum Temperature Profiles Over 6 Weeks

for 2/27/2025 to 4/9/2025

From April 3, 2025, through April 9, 2025, there were two recorded temperature increases and one temperature decrease that triggered the notification limits set forth in the LEA's October 4, 2024 letter. The temperature increase and decrease listed under TP-16 below are not included in these totals as they were the result of erroneous temperature readings and were not indicative of actual temperatures.

Additionally, as of April 4, 2025, twelve new TMPs (TMP-21, TMP-24, TMP-25, TMP-26, TMP-27, TMP-28, TMP-29, TMP-30, TMP-31, TMP-32, TMP-34, and TMP-35) have been installed and are online. None of these twelve new TMPs indicate reaction temperatures occurring outside of the currently delineated data-driven reaction area boundary, and the four TMPs that were able to be drilled to within 25 feet of the liner (TMP-24, TMP-27, TMP-31, and TMP-32) show significantly cooler temperatures at the deepest thermocouple, as expected due to the cooling from the underlying earth. This data further supports the previous conclusions of cooler temperatures near the liner and the liner's integrity being uncompromised by elevated temperatures.

Chiquita provides the following updates:

- TP-04
  - The 30-foot thermocouple was taken offline on April 2nd for testing and diagnostics and reconnected on April 3rd. Since re-installation, TP-04 has been consistently reporting temperatures of 166°F, indicating the previous temperatures were likely erroneous and the result of issues with the thermocouple that are now resolved.

- TP-06
  - During field investigation of TP-06, the thermocouples were evaluated and found to have had errors and failures since being brought back online from filling operations. Any temperature readings from the date that the thermocouples were brought back online were likely erroneous and any decreases or increases in temperatures were in error. The failed sensors were replaced and re-wired on April 4th.The maximum recorded temperature at TP-06 since the replacement and re-wiring is 138°F. However, the 100-foot thermocouple is reading in error and is being evaluated. Note that the vertical temperature profile for TP-06 will be corrected in future weeks when we will have a full week of correct data.

- TP-15
  - The 30-foot thermocouple showed an increase in maximum temperature of 17°F from 140°F to 157°F from April 1st to April 4th, then an increase in maximum temperature of 19°F from 157°F to 176°F from April 4th to April 7th, and then a decrease in maximum temperature of 18°F from 176°F to 158°F from April 7th to April 9th.

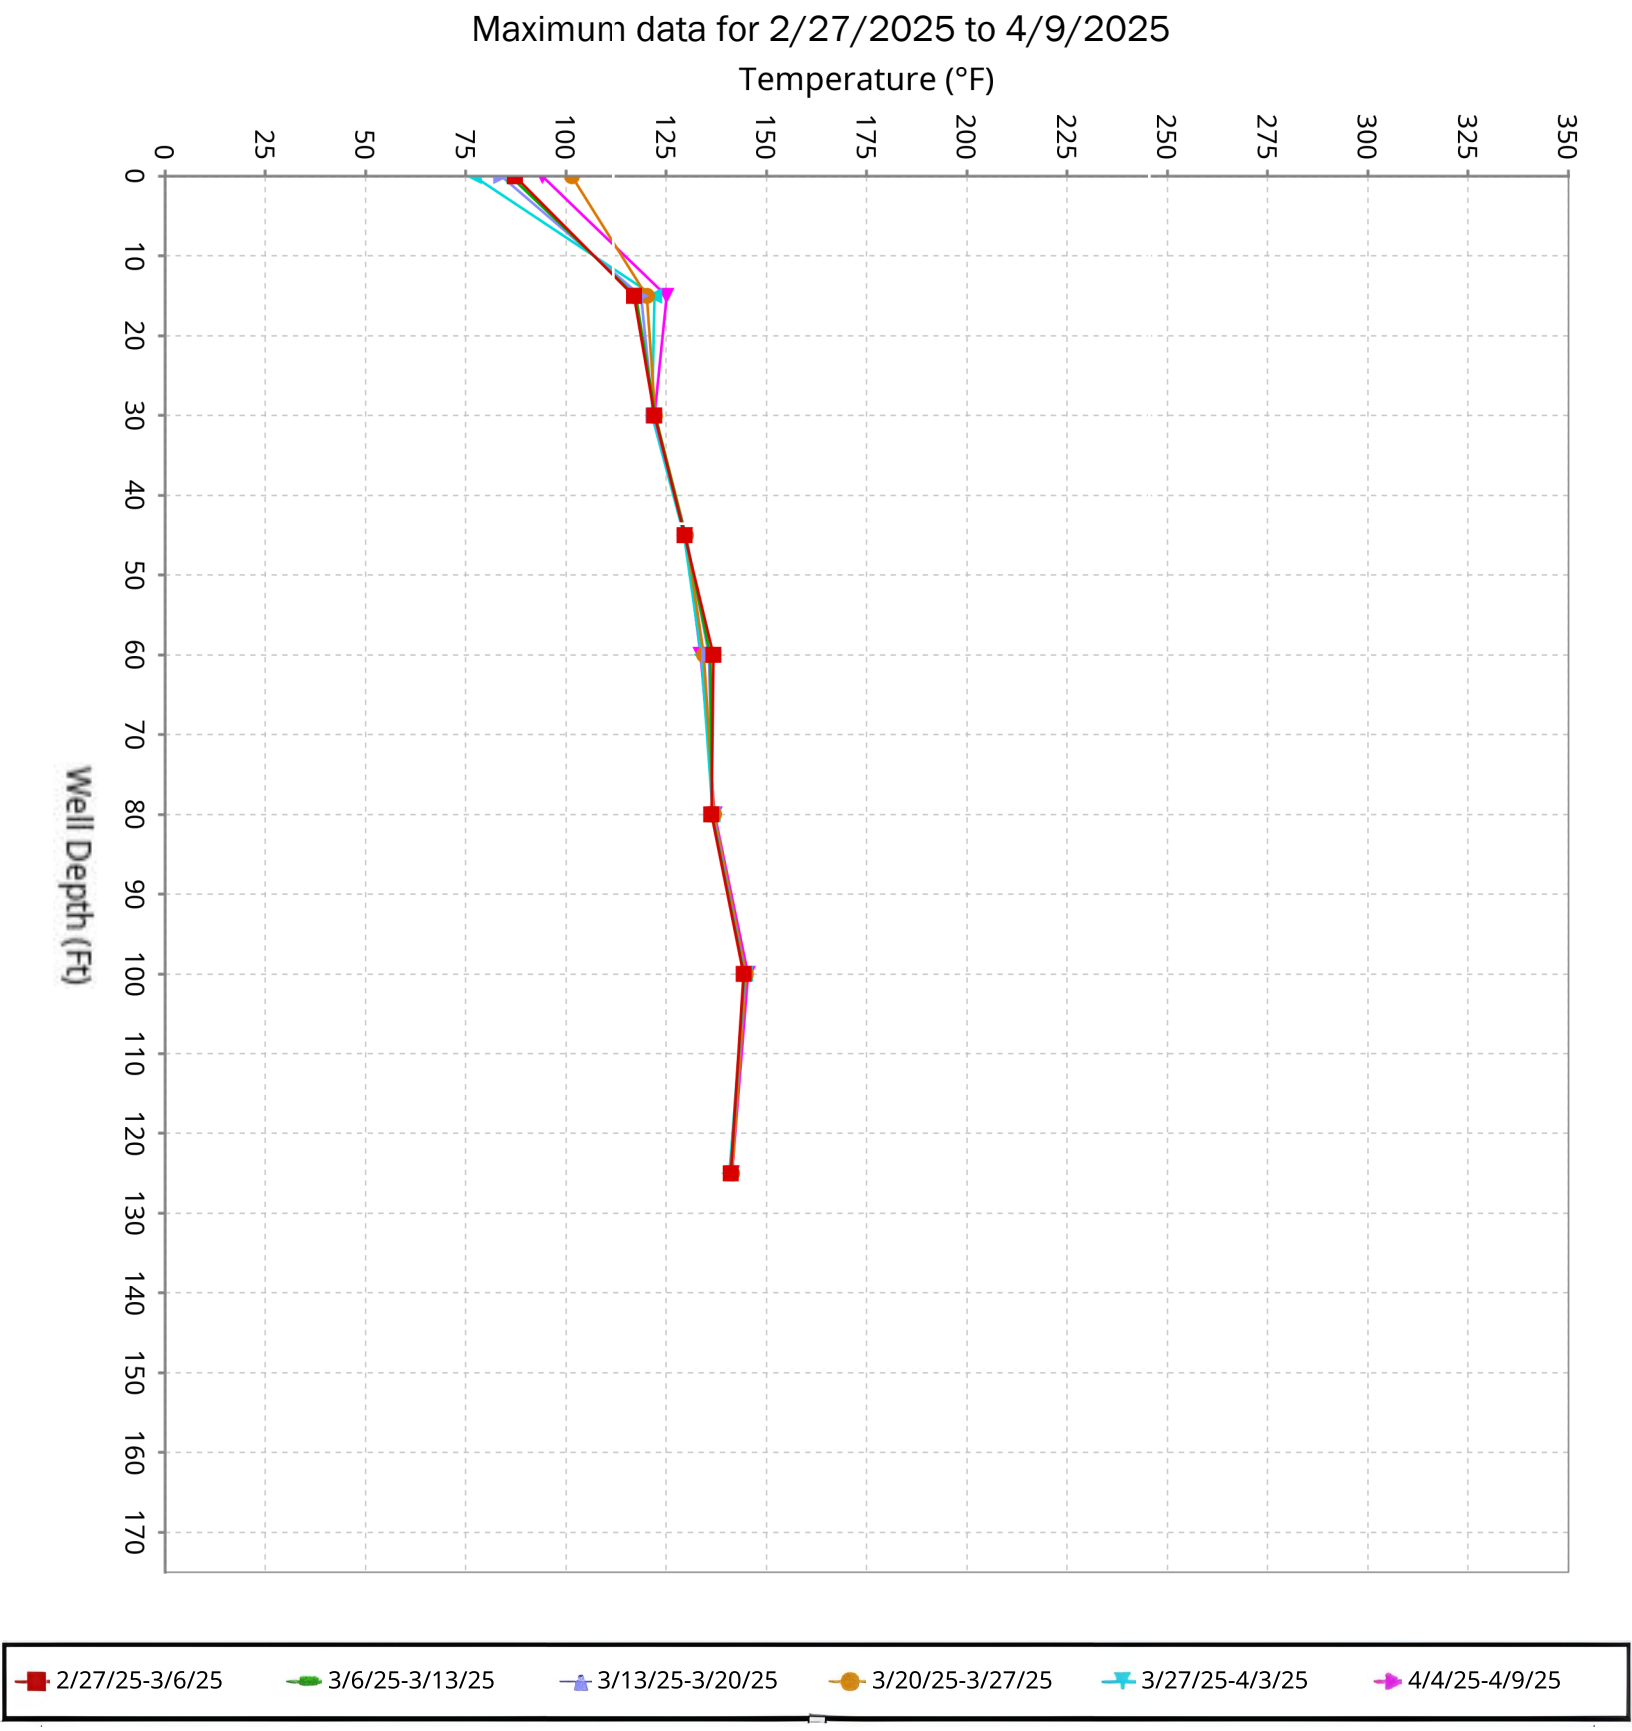

- TP-16
  - The 45-foot thermocouple showed an increase in maximum temperature of 69°F from 128°F to 197°F from April 5th to April 6th, and then a decrease in maximum temperature of 70°F from 197°F to 127°F from April 6th to April 8th. This daily maximum temperature increase occurred in a single reporting hour, which indicated erroneous temperature reading and is not indicative of actual temperatures.

SHEET: 1

Solid Waste Borehole Maximum Temperature Profiles Over 6 Weeks

for 3/6/2025 to 4/16/2025

From April 10, 2025, through April 16, 2025, there were three recorded temperature increases and three temperature decreases that triggered the notification limits set forth in the LEA's October 4, 2024 letter.

Additionally, as of April 4, 2025, twelve new TMPs (TMP-21, TMP-24, TMP-25, TMP-26, TMP-27, TMP-28, TMP-29, TMP-30, TMP-31, TMP-32, TMP-34, and TMP-35) have been installed and are online. None of these twelve new TMPs indicate reaction temperatures occurring outside of the currently delineated data-driven reaction area boundary, and the four TMPs that were able to be drilled to within 25 feet of the liner (TMP-24, TMP-27, TMP-31, and TMP-32) show significantly cooler temperatures at the deepest thermocouple, as expected due to the cooling from the underlying earth. This data further supports the previous conclusions of cooler temperatures near the liner and the liner's integrity being uncompromised by elevated temperatures.

Chiquita provides the following updates:

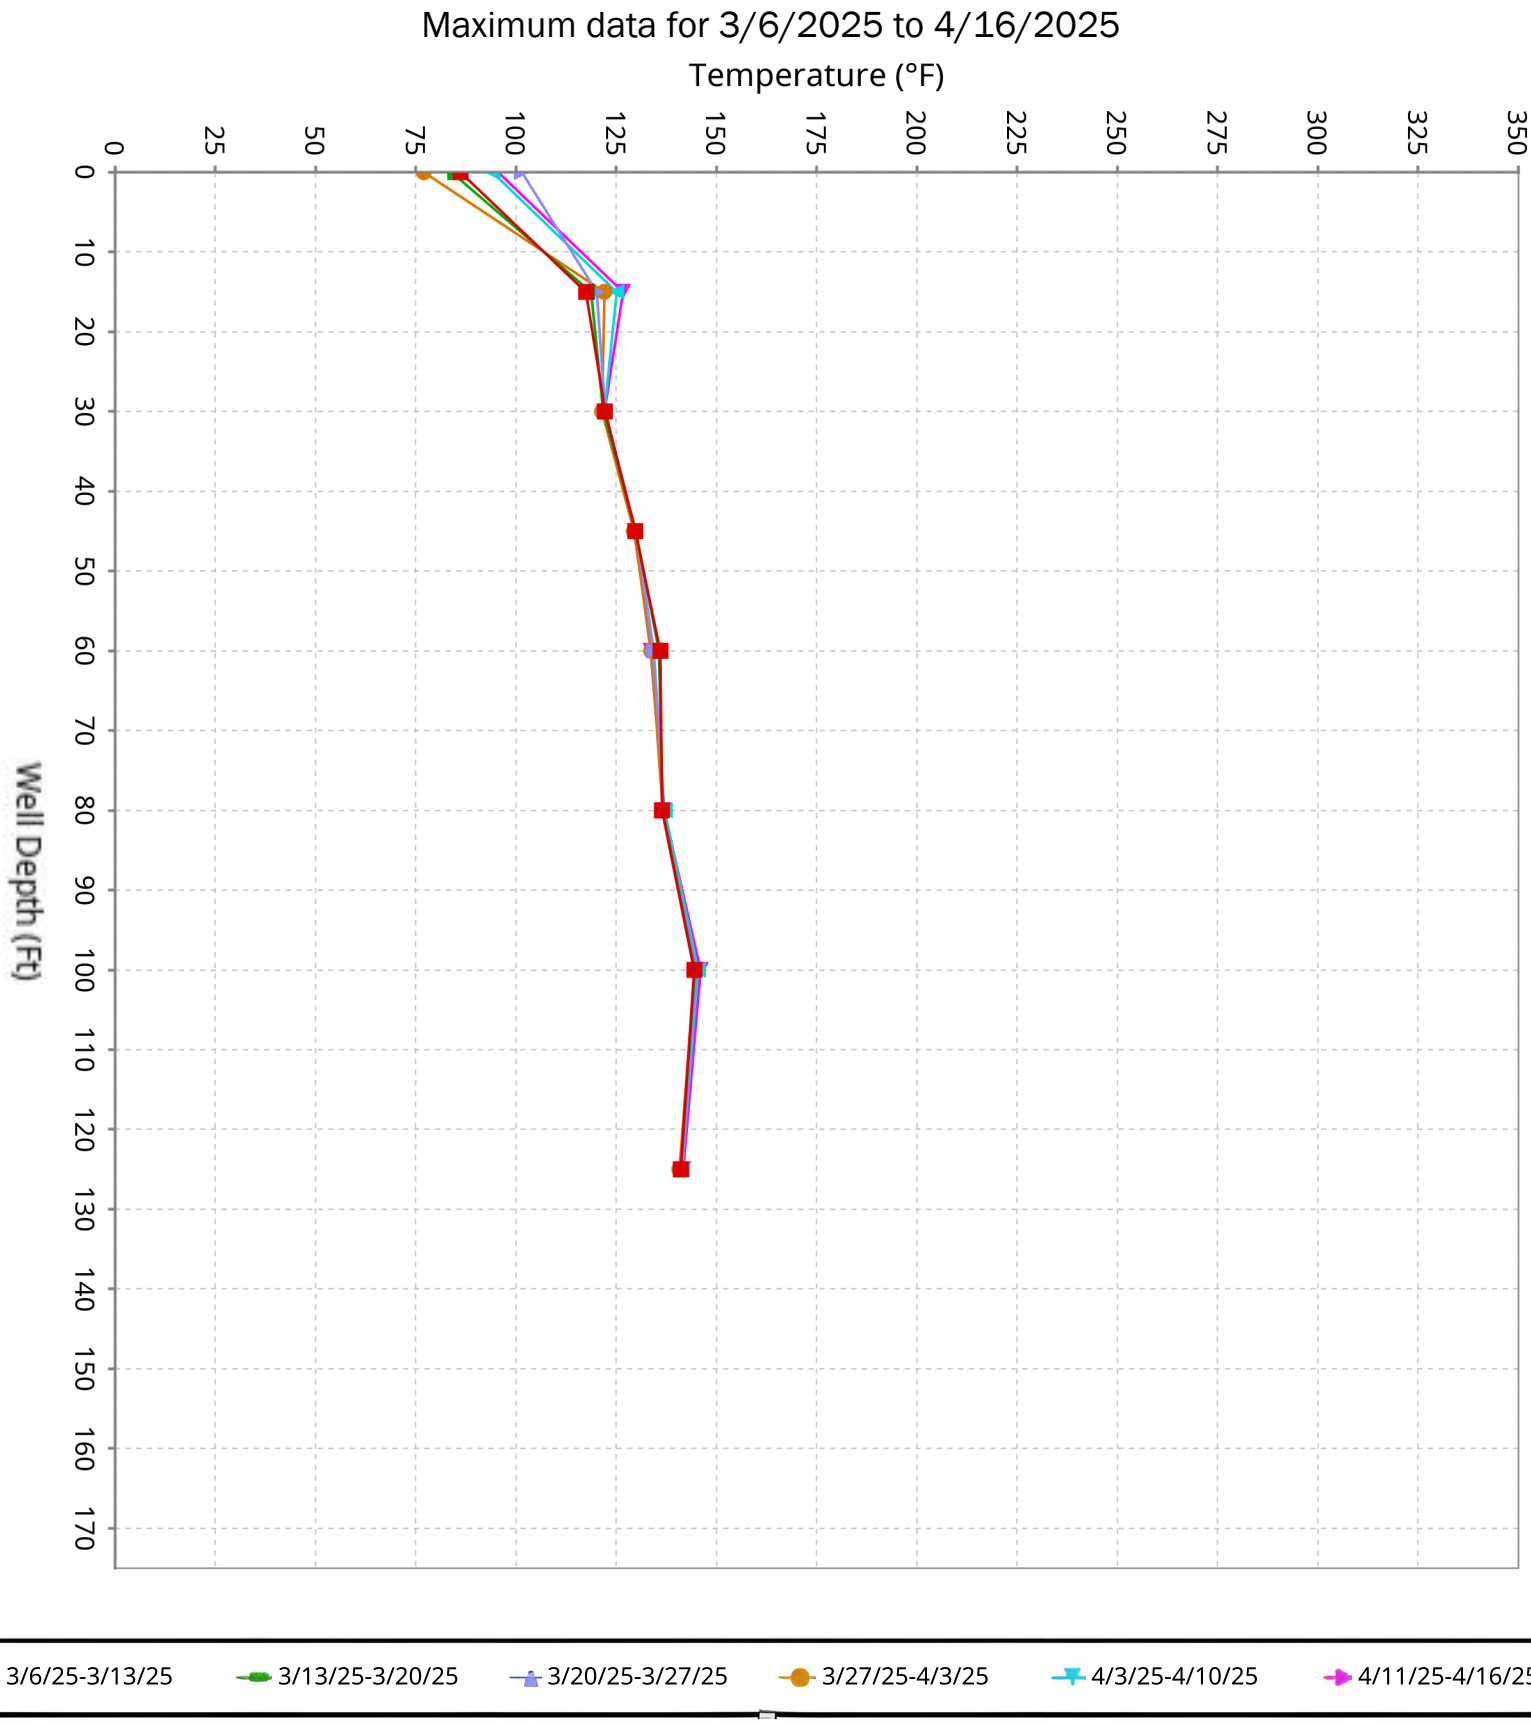

- TP-06
  - During field investigation of TP-06, the thermocouples were evaluated and found to have had errors and failures since being brought back online from filling operations. Any temperature readings from the date that the thermocouples were brought back online were likely erroneous and any decreases or increases in temperatures were in error. The failed sensors were replaced and re-wired on April 4th. The maximum recorded temperature at TP-06 since the replacement and re-wiring is 138°F. However, the 100-foot thermocouple is reading in error and is being evaluated. Note that the vertical temperature profile for TP-06 will be corrected in future weeks when we will have multiple weeks of correct data.
- TP-15
  - The 30-foot thermocouple showed an increase in maximum temperature of 16°F from 158°F to 174°F from April 9th to April 10th, then a decrease in maximum temperature of 12°F from 174°F to 162°F from April 10th to April 11th, then an increase in maximum temperature of 17°F from 162°F to 179°F from April 11th to April 12th, then a decrease in maximum temperature of 17°F from 179°F to 162°F from April 12th to April 13th, then an increase in maximum temperature of 12°F from 162°F to 174°F from April 13th to April 14th, and then a decrease in maximum temperature of 15°F from 174°F to 159°F from April 14th to April 16th, for an overall increase in maximum temperature of 1°F.
- TP-16
  - The 45-foot thermocouple remained consistent with previous recorded temperatures.

SCALE: AS SHOWN

SHEET: 1

Solid Waste Borehole Maximum Temperature Profiles Over 6 Weeks

for 3/13/2025 to 4/23/2025

From April 17, 2025, through April 23, 2025, there were two recorded temperature increases and two temperature decreases that triggered the notification limits set forth in the LEA's October 4, 2024 letter.

Additionally, as of April 4, 2025, twelve new TMPs (TMP-21, TMP-24, TMP-25, TMP-26, TMP-27, TMP-28, TMP-29, TMP-30, TMP-31, TMP-32, TMP-34, and TMP-35) have been installed and are online. None of these twelve new TMPs indicate reaction temperatures occurring outside of the currently delineated data-driven reaction area boundary, and the four TMPs that were able to be drilled to within 25 feet of the liner (TMP-24, TMP-27, TMP-31, and TMP-32) show significantly cooler temperatures at the deepest thermocouple, as expected due to the cooling from the underlying earth. This data further supports the previous conclusions of cooler temperatures near the liner and the liner's integrity being uncompromised by elevated temperatures.

Chiquita provides the following updates:

- TP-06
  - During field investigation of TP-06, the thermocouples were evaluated and found to have had errors and failures since being brought back online from filling operations. Any temperature readings from the date that the thermocouples were brought back online were likely erroneous and any decreases or increases in temperatures were in error. The failed sensors were replaced and re-wired on April 4th. The maximum recorded temperature at TP-06 since the replacement and re-wiring is 138°F. However, the 100-foot thermocouple is reading in error and has been evaluated. After a below grade evaluation of TP-06, the 2-inch casing was found to be bent, which was causing the 100-foot thermocouple to no longer read temperatures. On April 23rd a new thermocouple was attempted to be installed but could not be advanced beyond 20 feet due to issues causing the thermocouple to be unable to be removed or re-installed beyond repairable depth. A 100-foot thermocouple cannot be re-installed and future data and graphs will no longer include information from a 100-foot thermocouple. Note that the vertical temperature profile for TP-06 will be corrected in future weeks when we have multiple weeks of correct data and no past data issues that affect previous weeks' graphs.

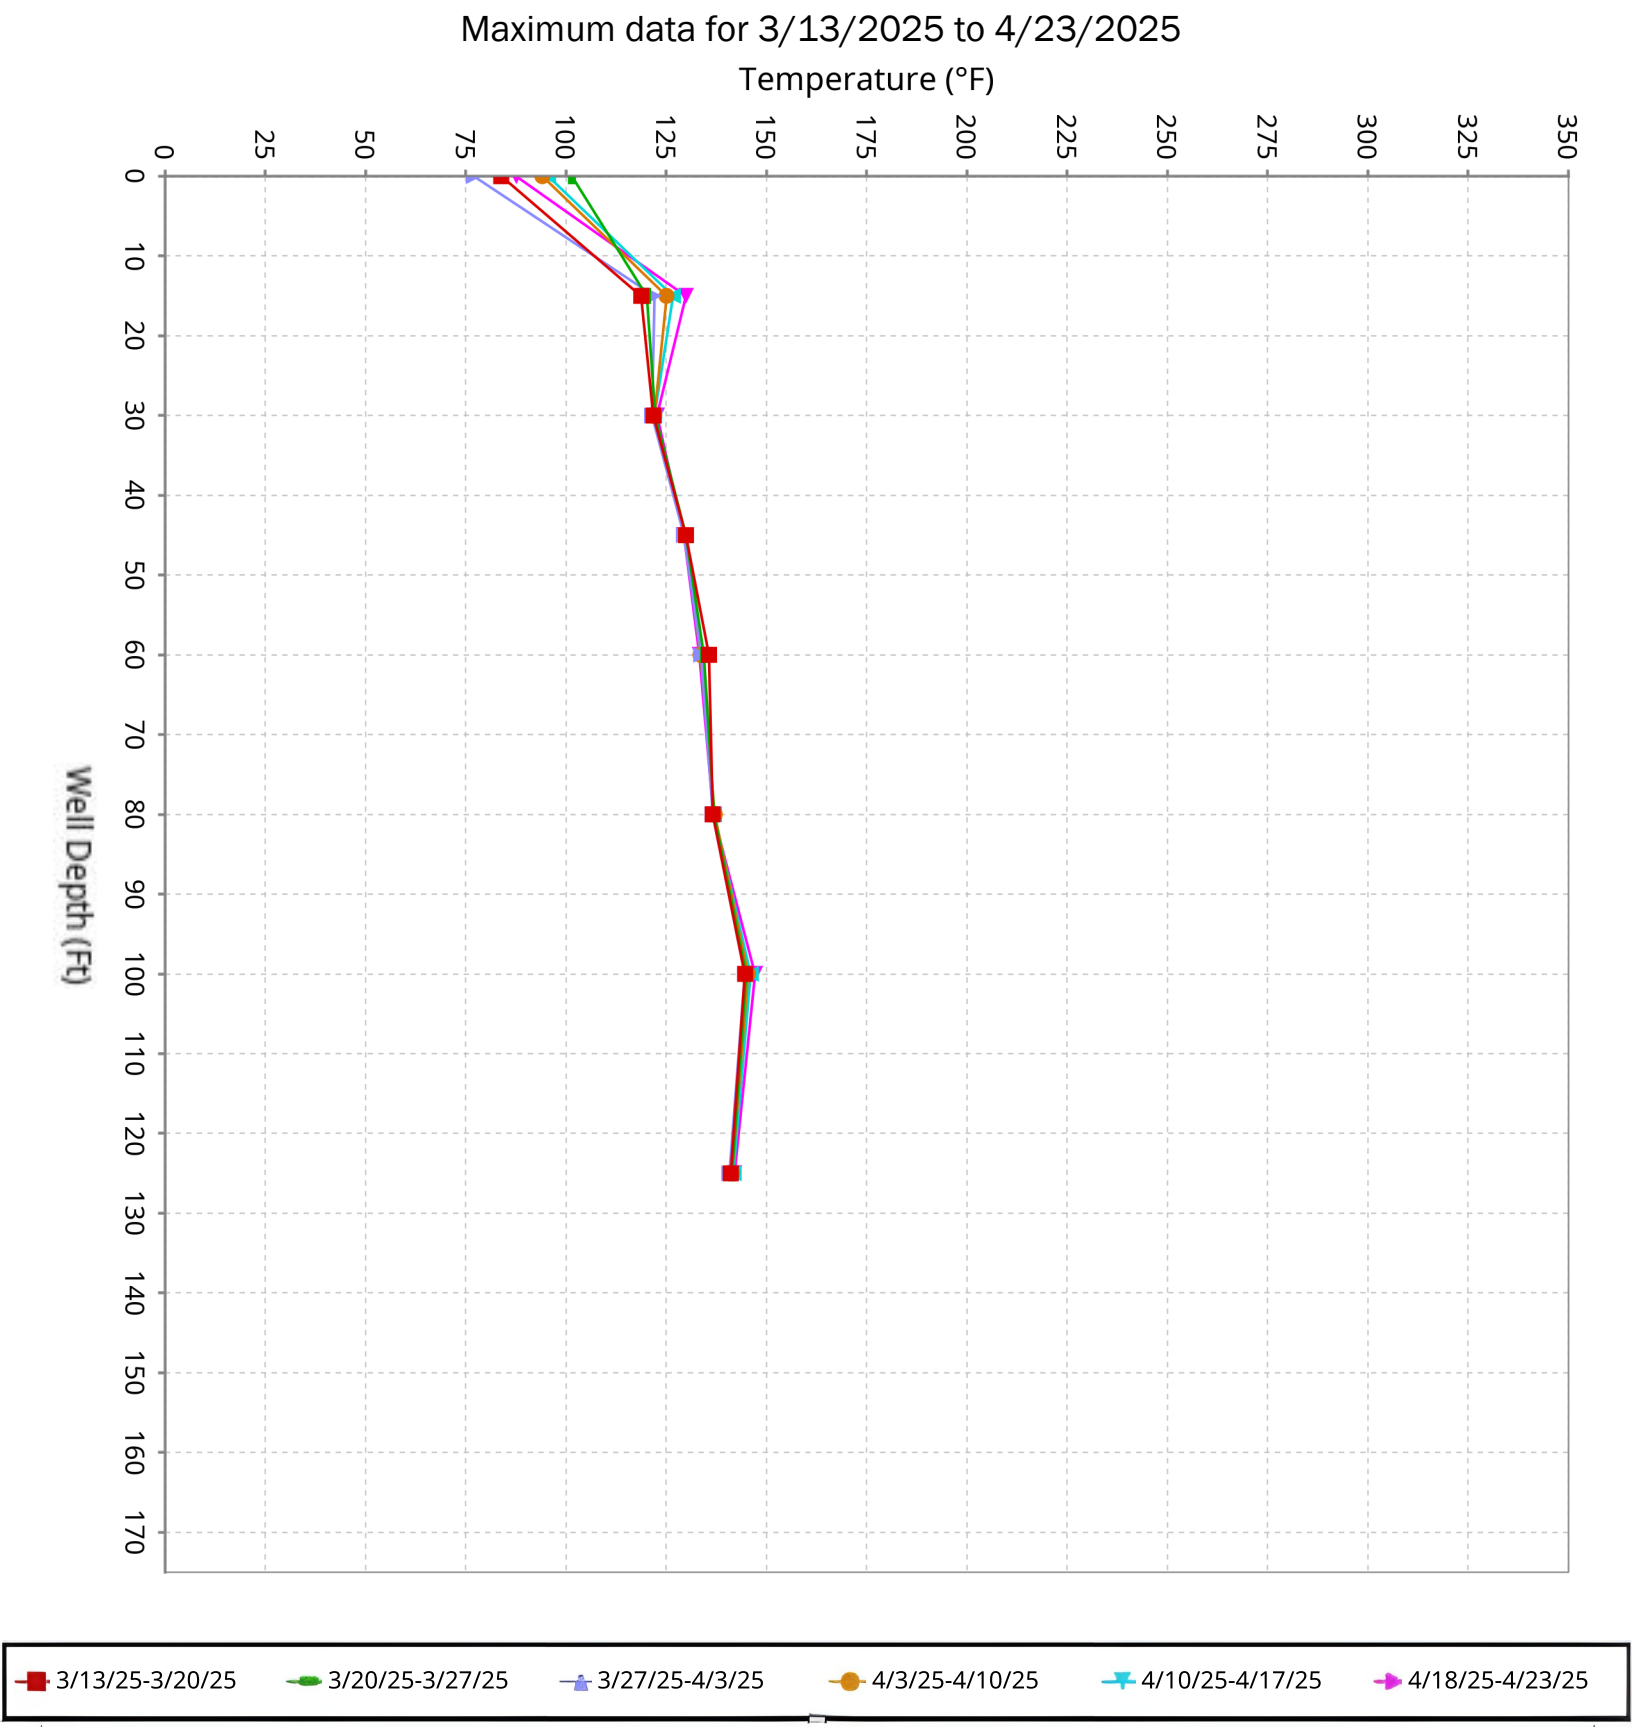

- TP-15
  - The 30-foot thermocouple showed an increase in maximum temperature of 29°F from 159°F to 188°F from April 16th to April 19th, then a decrease in maximum temperature of 18°F from 188°F to 170°F from April 19th to April 21st, then an increase in maximum temperature of 14°F from 170°F to 184°F from April 21st to April 22nd, and then a decrease in maximum temperature of 13°F from 184°F to 171°F from April 22nd to April 23rd, for an overall increase in maximum temperature of 12°F.

SHEET: 1

Solid Waste Borehole Maximum Temperature Profiles Over 6 Weeks

for 3/20/2025 to 4/30/2025

From April 24, 2025, through April 30, 2025, there were two recorded temperature increases and two temperature decreases that triggered the notification limits set forth in the LEA's October 4, 2024 letter.

Additionally, as of April 4, 2025, twelve new TMPs (TMP-21, TMP-24, TMP-25, TMP-26, TMP-27, TMP-28, TMP-29, TMP-30, TMP-31, TMP-32, TMP-34, and TMP-35) have been installed and are online. None of these twelve new TMPs indicate reaction temperatures occurring outside of the currently delineated data-driven reaction area boundary, and the four TMPs that were able to be drilled to within 25 feet of the liner (TMP-24, TMP-27, TMP-31, and TMP-32) show significantly cooler temperatures at the deepest thermocouple, as expected due to the cooling from the underlying earth. This data further supports the previous conclusions of cooler temperatures near the liner and the liner's integrity being uncompromised by elevated temperatures.

Chiquita provides the following updates:

- TP-06
  - As stated in last week's report, during field investigation of TP-06, the thermocouples were evaluated and found to have had errors and failures since being brought back online from filling operations. Any temperature readings from the date that the thermocouples were brought back online were likely erroneous and any decreases or increases in temperatures were in error. The failed sensors were replaced and re-wired on April 4th. The maximum recorded temperature at TP-06 since the replacement and re-wiring is 138°F. However, the 100-foot thermocouple was reading in error and has been evaluated. After a below grade evaluation of TP-06, the 2-inch casing was found to be bent which was causing the 100-foot thermocouple to no longer read temperatures. On April 23rd a new thermocouple was attempted to be installed but could not be advanced beyond 20 feet due to issues causing thermocouple not being able to be removed or re-installed beyond repairable depth. On April 29th field crews were able to reinsert the 100-foot thermocouple by removing all thermocouples and re-installing them together. Note that the vertical temperature profile for TP-06 will be corrected in future weeks when we have multiple weeks of correct data and no past data issues that throw off previous weeks graphs.

- TP-09
  - The past week of readings at TP-09 have shown no variability and upon field investigation, the battery for TP-09 was found to have failed likely due to poor cell network connection rapidly draining the battery. A new battery will be ordered and re-installed as soon as reasonably possible.

- TP-15
  - The 30-foot thermocouple showed an increase in maximum temperature of 15°F from 171°F to 186°F from April 23rd to April 26th, then a decrease in maximum temperature of 25°F from 186°F to 161°F from April 26th to April 28th, and then an increase in maximum temperature of 21°F from 161°F to 182°F from April 28th to April 30th, for an overall increase in maximum temperature of 11°F.

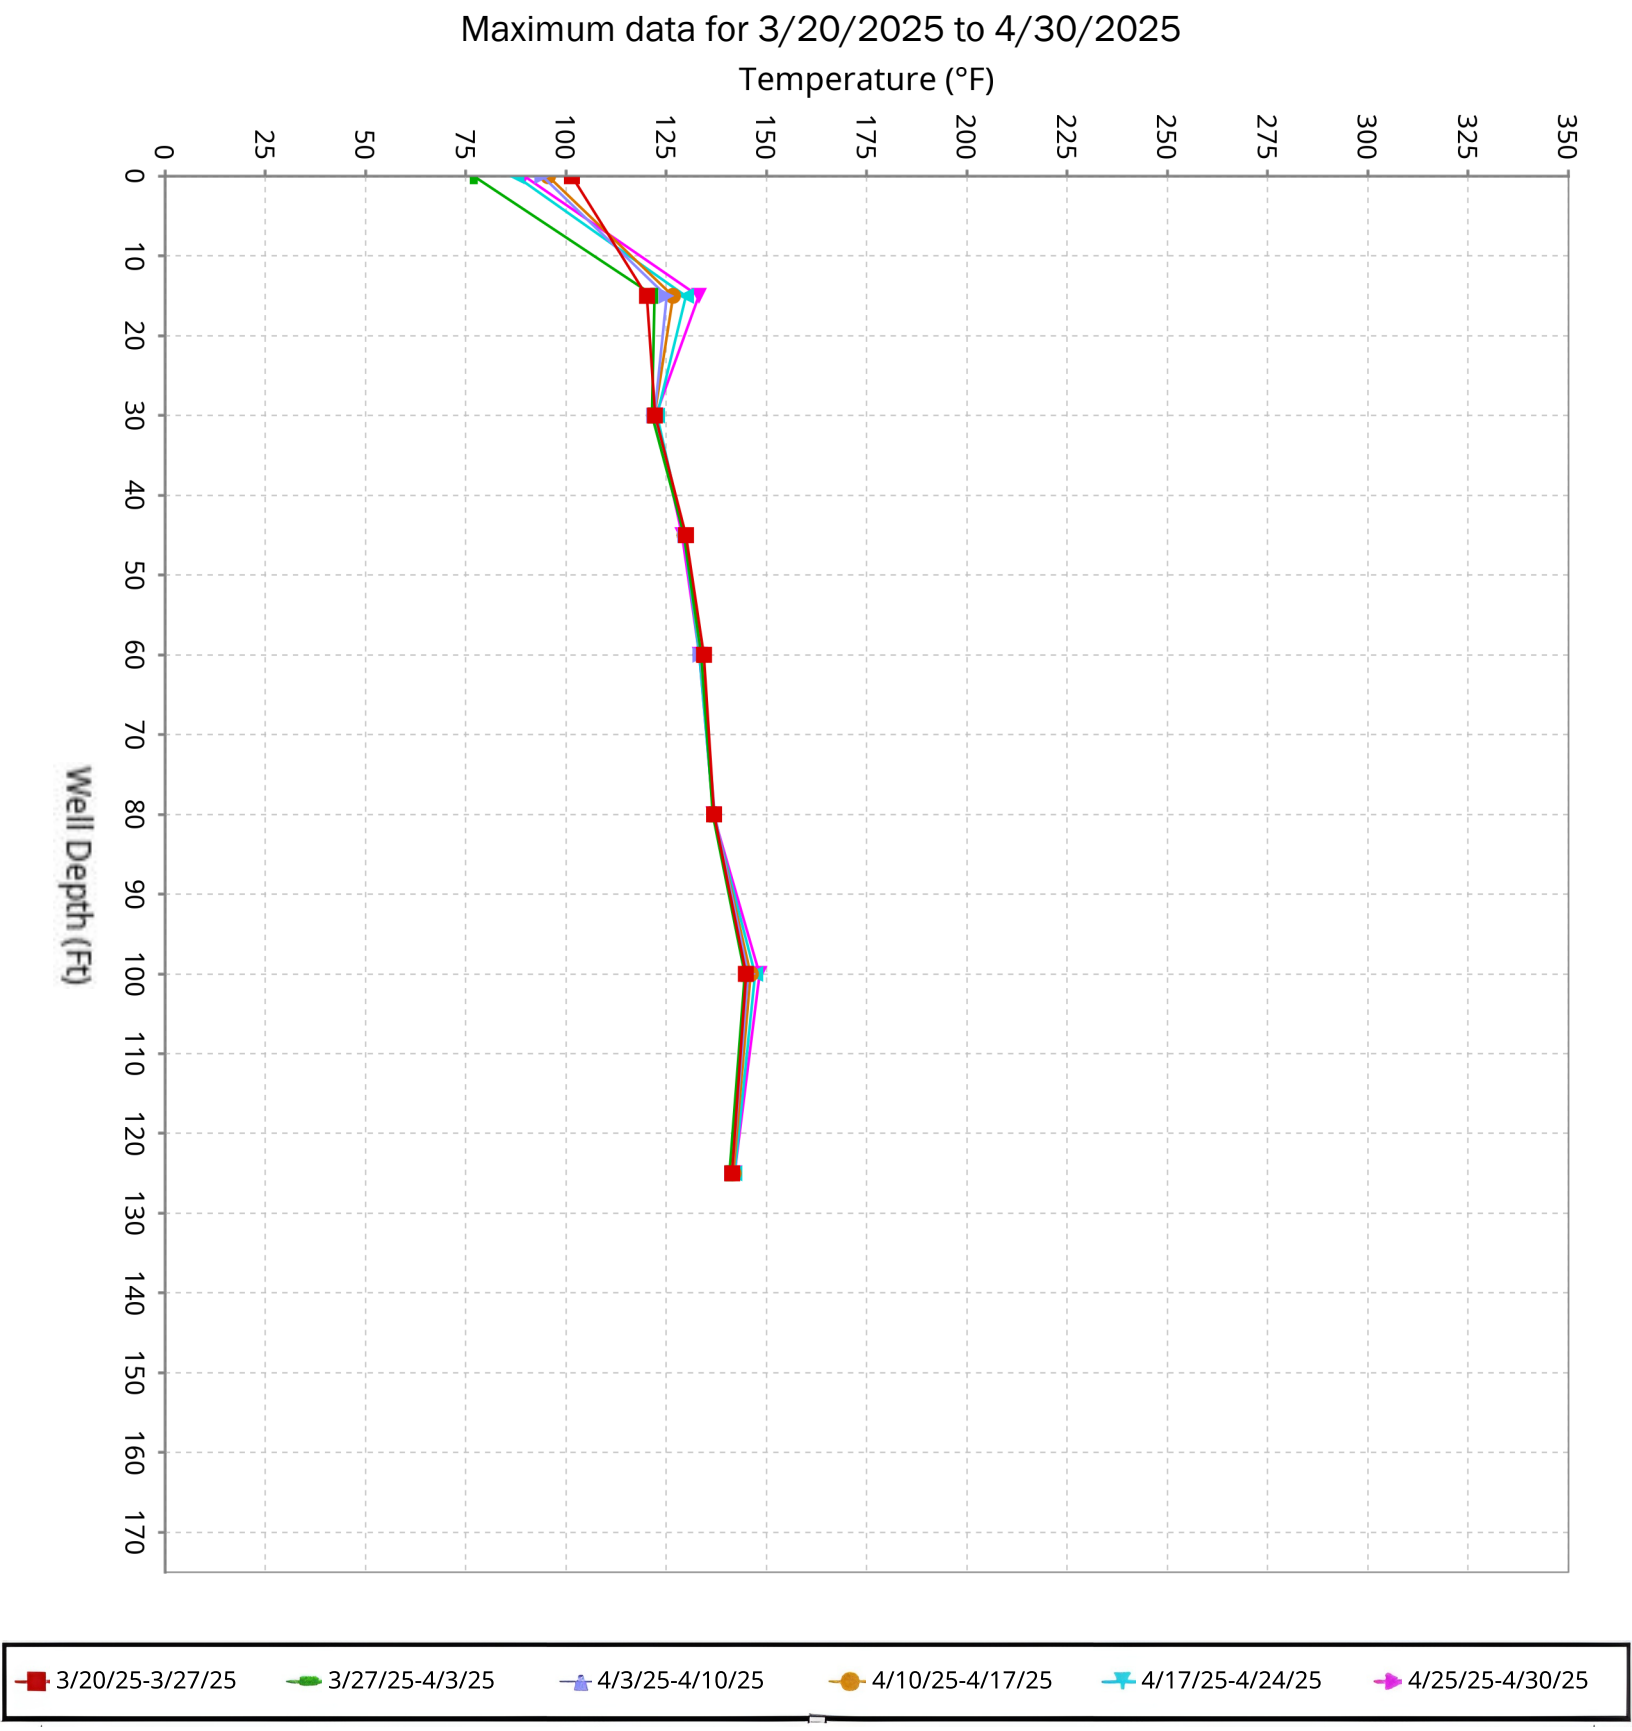

- TP-21
  - The 85-foot thermocouple showed a decrease in maximum temperature of 11°F from 221°F to 210°F from April 23rd to April 27th.

Subject: Monthly Reaction Committee Determination on Reaction Area Boundary
Chiquita Canyon Landfill – Castaic, California

Dear Mr. Chen:

In accordance with Condition Nos. 9a and 9b of the Modified Stipulated Order for Abatement (SOFA) pertaining to the Chiquita Canyon Landfill (Landfill or Facility) (Case No. 6177-4), the Reaction Committee has reviewed newly acquired applicable data recorded during the month of April 2025, considered revisions of the estimated extent of elevated temperature landfill (ETLF) conditions exhibited at the subject Facility (referred to as the "Reaction Area" limits), and has prepared this determination on potentially revising the Reaction Area map.

Attachment A presents the Drawing, titled "Reaction Area Map", prepared by SCS Engineers (SCS) and dated 5/5/25. The Drawing depicts the Reaction Area boundary as prescribed in Condition No. 9a, which corresponds to the limits of Cells 1/2A, 2B/3, 4, and Module 2B/3/4 P2, as a solid black line. The Drawing also depicts the estimated extent of ETLF conditions being experienced at the site based on the Reaction Committee's review of scientific data as a dashed magenta line. The rationale that serves as the basis for considering adjustments and modifications to the Reaction Area boundary (or the determination to maintain the decreed boundary), include the following:

- LFG wellhead temperatures in excess of approximately 160 degrees Fahrenheit.
- Poor gas quality (defined as methane levels of less than 30 percent) in conjunction with methane-to-carbon dioxide (CH_4:CO_2) ratios less than 1.0.
- The concentration of hydrogen (H_2) in the LFG measured greater than 2 percent by volume.
- The concentration of carbon monoxide (CO) in the LFG measured greater than 2,000 ppm.
- Accelerated settlement of the landfill surface, defined as approximately 18 inches or greater within a 60-day period, and cracks in landfill cover. This corresponds to a strain value (i.e., settlement rate) rate of 3 percent per year for areas with a 300-foot waste column depth, which we believe is a reasonable average depth in the subject area of interest.
- First-hand observations of Landfill and/or SCS engineering, construction, and operations and maintenance (O&M) field personnel who are on-site related to: 1) atypical excess leachate quantities (presence and quantity of liquids); 2) instances of pressurized liquids emitting from the landfill surface, from boreholes during drilling, and from LFG wells; and, 3) the characteristics of the odors originating from the select areas of the waste footprint (often

described as “chemical-like” and distinctly different from typical LFG or landfill working face odors).

- Observations of subsurface waste conditions and characteristics as noted on borehole drilling logs for recently installed new wells and/or probes.

- Subsurface temperatures recorded at the in-situ waste temperature probes during April 2025.

- Temperature of gas or liquids measured at depth within the LFG well riser pipe (using an automated transmitter or manual field instrumentation).

- Since there were no drilling activities for new waste temperature probes during April 2025, there was no new data related to subsurface temperature and pressures associated with drilling.

CONSIDERATIONS FOR POTENTIAL ADJUSTMENTS TO THE ESTIMATED EXTENT OF ETLF CONDITIONS (DASHED MAGENTA LINE)

In making its monthly determinations, the Reaction Committee evaluates the above set of data parameters, in conjunction with one another, to identify meaningful trends indicating ETLF conditions, as opposed to fluctuations exhibited in isolated datapoints.

Each month, the Reaction Committee scrutinizes particular areas of the Landfill that have previously exhibited abnormal or fluctuating data, when applicable. As discussed below, despite minor variances in discrete areas of the landfill, the Committee has not discerned any meaningful trends with respect to the April 2025 data that would indicate the reaction has expanded into these areas.

Near CV-24083

During multiple monitoring events in March and April, well CV-24083 exhibited an average methane concentration of approximately 26 percent and an average LFG wellhead temperature of approximately 162 degrees Fahrenheit. At the adjacent well CV-24070, which is positioned closer to the current estimated extent of ETLF conditions (dashed magenta line) than CV-24083, the methane concentrations recorded during March and April averaged 33 percent and the temperatures averaged 136 degrees F. A review of the monitoring data recorded at three other wells adjacent to CV-24083 (CV-24071, CV-24082, and CV-24084) indicates that these three wells exhibited average wellhead temperatures below 145 degrees F during March and April. Furthermore, the maximum methane concentrations recorded at these three wells during this timeframe are between 42 and 49 percent, suggesting significant methanogenic activity is occurring. Accordingly, at this time, the Reaction Committee believes that no adjustment to the estimated extent of ETLF conditions in this discrete location is warranted, since the data recorded in April does not appear to signal a potential expansion of the subsurface reaction.

Near CV-24084 & TP-11

Considering the increasing temperatures recorded by the thermocouples at various depth intervals in TP-11 over the past several months, the Reaction Committee carefully considered the operating

parameters recorded at the co-located well CV-24084, along with conditions at adjacent wells CV-24071 and CV-24156. While the 30-day maximum temperature recorded at the 100-foot interval in TP-11 is 172 degrees F, the average LFG temperature at the co-located well CV-24084 is less than 145 degrees F. While the average methane concentration exhibited at well CV-24084 during multiple monitoring events in March and April of 20 percent is suppressed, a methane content of 42 percent was recorded on April 8th. The hydrogen concentrations at CV-24084 was 6.8 percent. The gas composition and temperatures at adjacent well CV-24156 are clearly inconsistent with ETLF conditions (methane content near 50 percent and temperatures less than 119 degrees). While adjacent well CV-24071 exhibited hydrogen greater than 2 percent, the average methane concentrations above 35 percent and low temperature values (below 130 degrees F) are likewise inconsistent with ETLF conditions. Accordingly, the Reaction Committee does not believe that any adjustment to the estimated extent of ETLF conditions in this discrete location is warranted at this time, since the data recorded in April does not appear to consistently signal a potential expansion of the subsurface reaction.

Near TP-24, TP-26, TP-29, TP-30, TP-31, and TP-32

On or about April 1, 2025, the Reaction Committee received documentation, prepared by Dr. Timothy D. Stark, Ph.D, PE, BC.GE and dated February 26, 2025, titled "Comments on November 26, 2024 Revised Soil Reaction Break/Barrier Plan and February 20,2025 Waste Temperature Data for Chiquita Canyon Landfill Subsurface Elevated Temperature (SET) Event". This document was included as Exhibit 6 in the California Environmental Protection Agency Department of Toxic Substances and Control Imminent and Substantial Endangerment Determination and Order, effective April 2, 2025. Figure 2 of this document presented a delineation of the SET Event that is inclusive of temperature monitoring probes TP-7, TP-29, TP-30, TP-31, and TP-32. The Reaction Committee reviewed the in-situ waste temperatures recorded at these five probes, as well as probe TP-24, and evaluated the surrounding LFG wells and field conditions in relation to the rationale that serves as the basis for considering adjustments and modifications to the Reaction Area boundary that are cited above. Based on this evaluation, there does not appear to be evidence of a potential expansion of the subsurface reaction into the portions of the waste mass along the delineation presented in Figure 2. Accordingly, the Reaction Committee does not believe that any adjustment to the estimated extent of ETLF conditions in this discrete location is warranted at this time, since the data recorded in April does not appear to consistently signal a potential expansion of the subsurface reaction

TEMPERATURE MONITORING PROBE DATA

The Reaction Committee reviewed the temperature measurements recorded during April 2025 by the in-situ temperature monitoring probes. As of April 2025, five (5) of the thirty-two (32) probes (TP-2, 3, 9, 15, and 21) are located within the current estimated extent of ETLF conditions (dashed magenta line). Of the remaining twenty-seven (27) probes positioned outside of the boundary, twelve (12) probes are positioned within relatively close proximity (within 200 feet) of this boundary. It is the Committee's opinion that the temperatures recorded by the 27 probes outside of the boundary during April 2025 are not indicative of a subsurface reaction and do not substantiate a decision to adjust the boundary of the reaction area at this time. Chiquita's submittal of temperature measurements to the Local Enforcement Agency, dated May 1, 2025, explained that the sensors in TP-06 *"were evaluated and found to have had errors and failures since being brought back online*

from filling operations. The failed sensors were replaced and re-wired on April 4th. The maximum recorded temperature at TP-06 since the replacement and re-wiring is 138°F."

The Reaction Committee evaluated the 30-day maximum temperatures recorded in TP-26 (173 degrees Fahrenheit at the 160-foot interval), TP-29 (183 degrees F at the 250-foot interval), TP-30 (170 degrees F at the 200-foot interval), and TP-31 (185 degrees F at the 190-foot interval). The Committee noted differentiation between the 30-day maximum temperatures in these four probes compared to the 30-day maximum temperatures measured at the three probes within the current estimated extent of ETLF conditions (dashed magenta line), specifically TP-3 (233 degrees F at 45-foot interval), TP-9 (223 degrees at the 125-foot interval), and TP-21 (257 degrees at the 110-foot interval). Based on this differentiation, along with consideration of the other relevant criteria and data parameters, the Reaction Committee does not believe an adjustment to the boundary of the reaction area to include the portions of the waste footprint inclusive of TP-26, TP-29, TP-30, and TP-31 is warranted at this time.

HYDROGEN CONCENTRATIONS

The Reaction Committee also evaluated the concentration of hydrogen in landfill gas (LFG) during April 2025. Recall that certain wells positioned to the south and east of the reaction area boundary (where dewatering pumping was reactivated) have periodically demonstrated some increased hydrogen content in the LFG during the Reaction Committee's review of the data in previous months, which similarly was the case for the April data. The Reaction Committee noted in its review of the data that these wells did not exhibit elevated temperatures, except for one isolated instance at well CV-24083. The most recent measurements recorded at this well confirm that sustained elevated temperature values have not been exhibited at this time and the maximum methane content during the past two months of 37 percent indicates that methanogenesis is still occurring. Other than the value at this well, there was no evidence of the increased heat that is typical with ETLF conditions present at the wells exhibiting atypical hydrogen concentrations. As noted previously, the Committee suspects this increased hydrogen content may be attributable to substantial dewatering being accomplished throughout the Reaction Area and may be associated with gas movement from within the Reaction Area by existing horizontal collectors in close proximity. Thus, the presence of elevated hydrogen in these isolated locations does not suggest that ETLF conditions are expanding south and east of the delineated boundary. Accordingly, the Reaction Committee does not believe an adjustment to the boundary of the reaction area is warranted at this time.

CONCLUSION

As presented on the Drawing included as **Attachment A**, the estimated extent of ETLF conditions (dashed magenta line) is fully contained within the Reaction Area boundary decreed in the SOFA (solid black line). Because the ETLF conditions are fully contained within the Reaction Area boundary and have not expanded into a new cell, the Reaction Committee finds no basis to modify the Reaction Area boundary as prescribed in Condition 9a at this time.

There was no dissenting opinion among the Reaction Committee members regarding this monthly determination. Supporting data is presented on the Drawing included as **Attachment A.** The maximum temperature measurements recorded at the 32 in-situ waste temperature monitoring probes during April are presented in **Attachment B** in graphical format. The landfill gas wellhead temperatures recorded at the extraction wells for the entire landfill footprint are reflected on the

isothermal gradient range map presented as **Attachment C**. The carbon monoxide (CO) concentrations measured at the landfill gas wellheads in the vicinity of the data-driven reaction area boundary are depicted on the range map presented as **Attachment D**. The electronic database and recordkeeping platform enables these measurements to be downloaded into a tabular spreadsheet format, which can be submitted to the South Coast Air Quality Management District under separate cover, if requested.

ATTACHMENT B

Solid Waste Borehole Maximum Temperature Profiles Over 6 Weeks

for 3/20/2025 to 4/30/2025

From April 24, 2025, through April 30, 2025, there were two recorded temperature increases and two temperature decreases that triggered the notification limits set forth in the LEA's October 4, 2024 letter.

Additionally, as of April 4, 2025, twelve new TMPs (TMP-21, TMP-24, TMP-25, TMP-26, TMP-27, TMP-28, TMP-29, TMP-30, TMP-31, TMP-32, TMP-34, and TMP-35) have been installed and are online. None of these twelve new TMPs indicate reaction temperatures occurring outside of the currently delineated data-driven reaction area boundary, and the four TMPs that were able to be drilled to within 25 feet of the liner (TMP-24, TMP-27, TMP-31, and TMP-32) show significantly cooler temperatures at the deepest thermocouple, as expected due to the cooling from the underlying earth. This data further supports the previous conclusions of cooler temperatures near the liner and the liner's integrity being uncompromised by elevated temperatures.

Chiquita provides the following updates:

- TP-06
  - As stated in last week's report, during field investigation of TP-06, the thermocouples were evaluated and found to have had errors and failures since being brought back online from filling operations. Any temperature readings from the date that the thermocouples were brought back online were likely erroneous and any decreases or increases in temperatures were in error. The failed sensors were replaced and re-wired on April 4th. The maximum recorded temperature at TP-06 since the replacement and re-wiring is 138°F. However, the 100-foot thermocouple was reading in error and has been evaluated. After a below grade evaluation of TP-06, the 2-inch casing was found to be bent which was causing the 100-foot thermocouple to no longer read temperatures. On April 23rd a new thermocouple was attempted to be installed but could not be advanced beyond 20 feet due to issues causing thermocouple not being able to be removed or re-installed beyond repairable depth. On April 29th field crews were able to reinsert the 100-foot thermocouple by removing all thermocouples and re-installing them together. Note that the vertical temperature profile for TP-06 will be corrected in future weeks when we have multiple weeks of correct data and no past data issues that throw off previous weeks graphs.

- TP-09
  - The past week of readings at TP-09 have shown no variability and upon field investigation, the battery for TP-09 was found to have failed likely due to poor cell network connection rapidly draining the battery. A new battery will be ordered and re-installed as soon as reasonably possible.

- TP-15
  - The 30-foot thermocouple showed an increase in maximum temperature of 15°F from 171°F to 186°F from April 23rd to April 26th, then a decrease in maximum temperature of 25°F from 186°F to 161°F from April 26th to April 28th, and then an increase in maximum temperature of 21°F from 161°F to 182°F from April 28th to April 30th, for an overall increase in maximum temperature of 11°F.

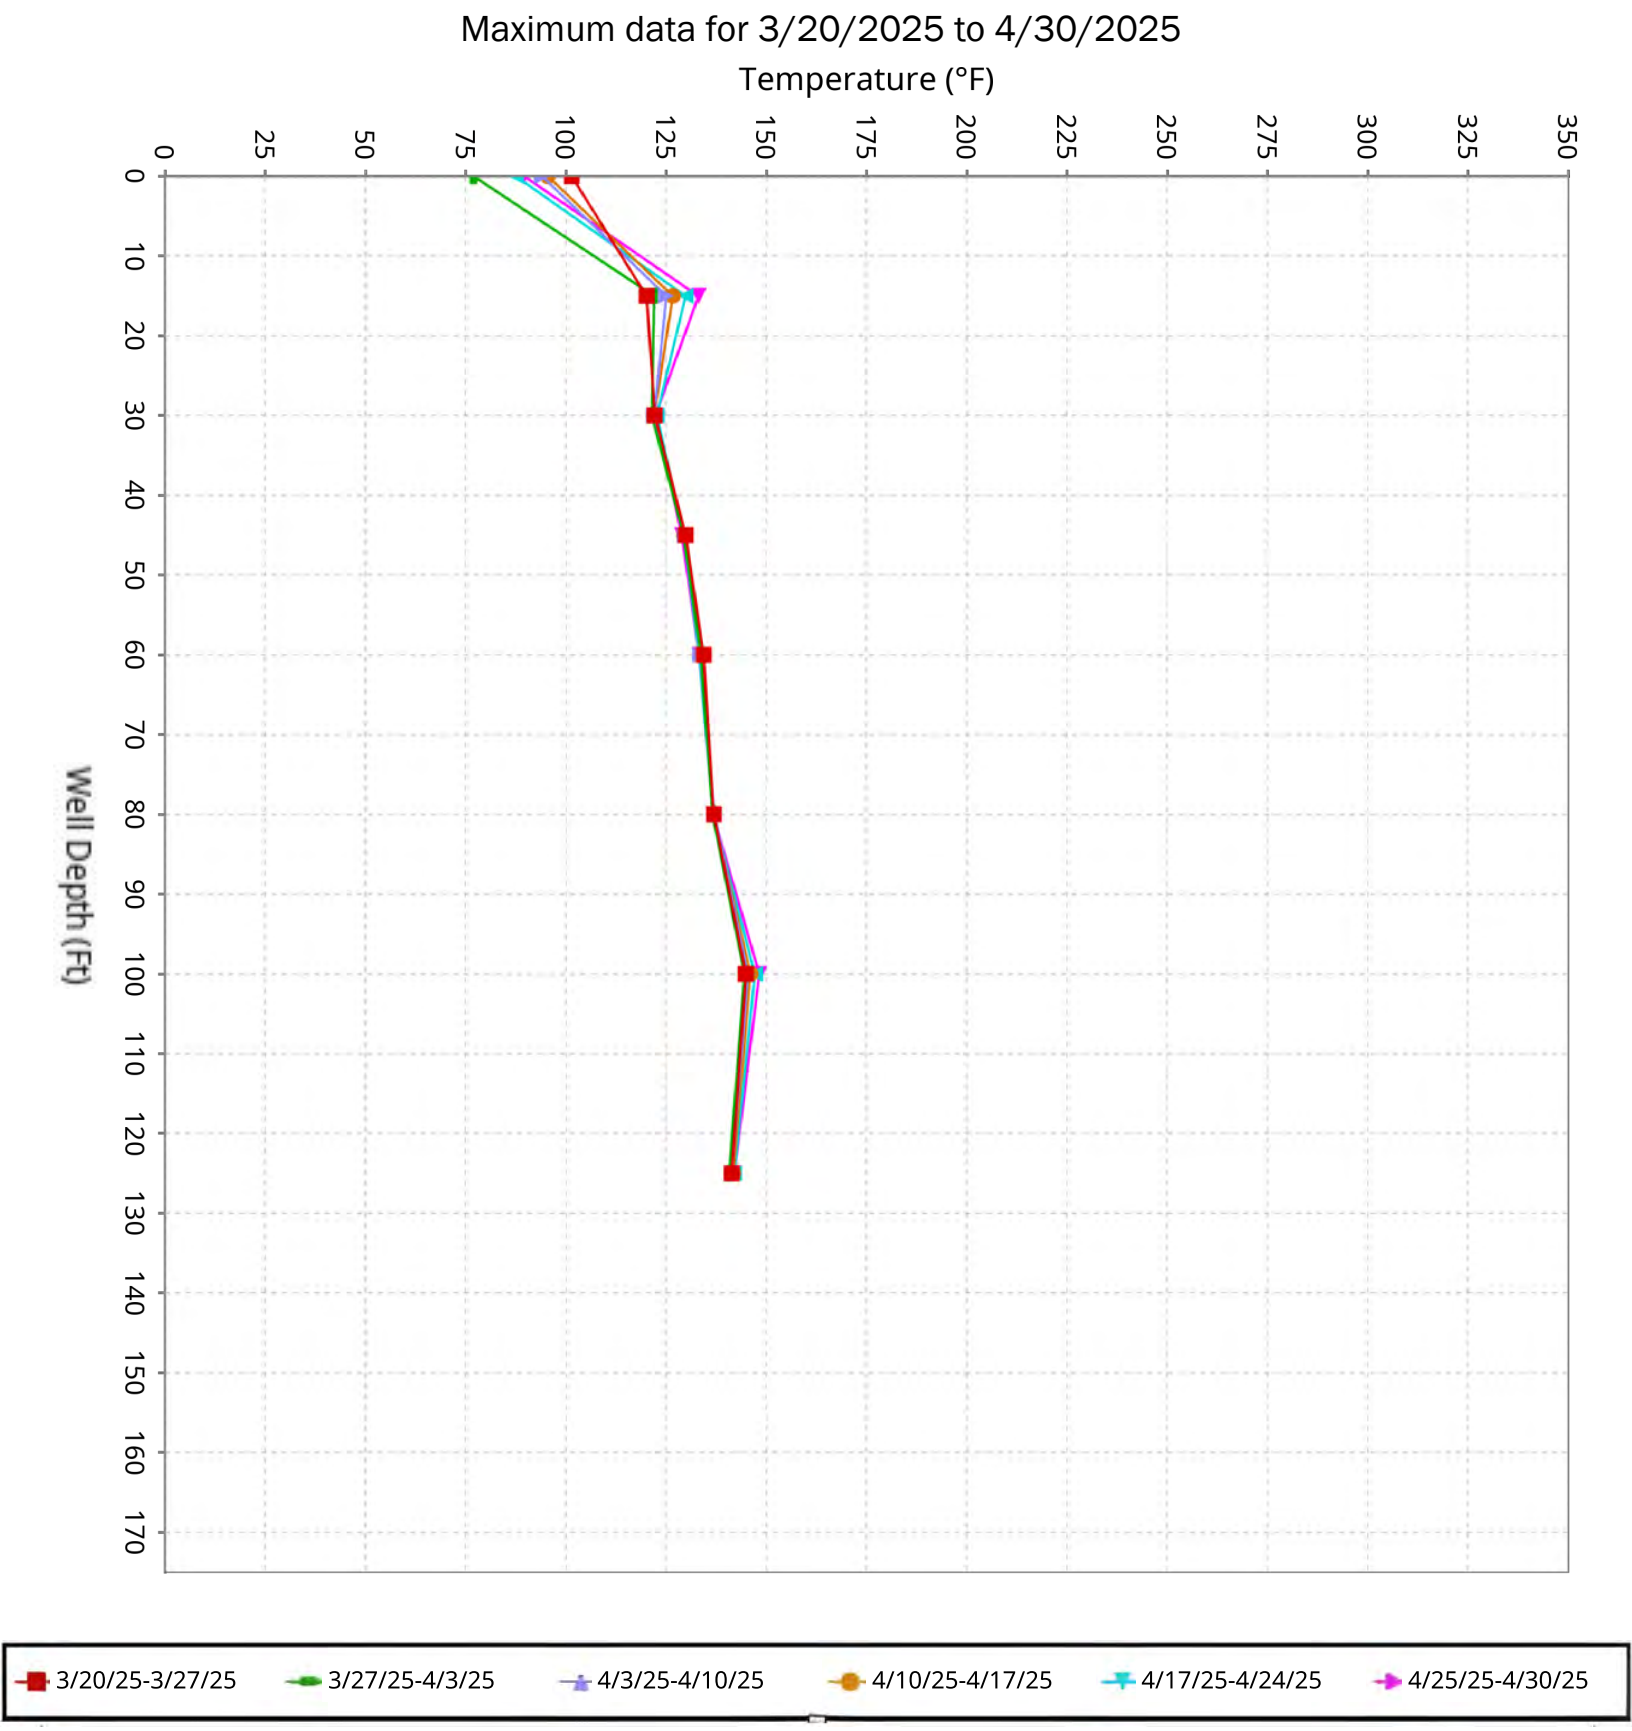

- TP-21
  - The 85-foot thermocouple showed a decrease in maximum temperature of 11°F from 221°F to 210°F from April 23rd to April 27th.
