Project Sample Media

SDG Number: 225100

The following sample media was used for this Sample Delivery Group (SDG). The Sample Media column identifies the type of media. For canisters, the Sample Media Batch gives the canister number followed by the cleaning batch number, which is a unique identification. The initial pressure of the canister when it is received is recorded. If the canister is not pressurized, the final pressure will be the same as the initial pressure. If the canister is pessurized the final pressure will be recorded, and the canister dilution factor is calculated as the ratio of the final to initial pressure. The results are adjusted for the can dilution factor.

Section 2 Quality Control

This section contains the QC Reports for each Daily Analytical Batch (DAB) which make up the Sample Delivery Group (SDG). It also contains either the EAS or Project QC criteria that was used for the DAB. The methods used for this project have been modified from the original method. The modifications include modifications to the QC for the method. This is either because the method did not specify certain aspects of the QC, the method was originally designed for a different matrix, or additional compounds were added to the target list of the method which required modified QC. The QC modifications used by EAS follows those used by other air testing laboratories.

The Daily Analytical Batch data was checked against the QC criteria for the method. Any deviations from the QC criteria are listed on the QC Reports for each DAB, which are summarized in this section and are given in more detail in Section 4 which has the Quantitation Reports and Calculations for the Samples, Method Blank, Lab Control Spikes, as well as the Initial Calibration and Continuing Calibration. This section contains the following:

Quality Control Report

EAS SDG Number: 225100

Project Number: 17807

QC Narrative

Samples were anlayzed in a daily analytical batch (DAB) designated by a QC batch number, and were analyzed using EAS standard laboratory QC specified in the EAS Quality Manual which may be different then the referrenced agency method. Any deviations from the EAS QC criteria are flagged in the Laboratory Control Reports or in the sample Analytical Reports.

Standard Laboratory QC Report

Unless project specific QC was requested, this Section containing the standard laboratory QC (Level 2) supplied with the Analytical Reports. Each sample is analyzed in a Daily Analytical Batch (DAB) which includes the method blank, a laboratory control spike (LCS) and a laboratory control duplicate (LCD). A Daily Analytical Batch QC report is supplied for each method requested.

Method Blank

The method blank is a laboratory generated sample which assesses the degree to which laboratory operations cause a false positive. The target analytes in the analytical reports for a daily analytical batch are "B" flagged if their concentrations are present in the Method Blank above the RL, unless the result is greater then ten times the blank value..

Laboratory Control Spike

A laboratory control spike is a well characterized matrix similar to the sample which is spiked and run in duplicate with each Daily Analytical Batch. The laboratory control spike results are reported as a percent recovery. The QC Criteria for the control spike is listed in the Laboratory Control Report. Any results outside the control limits are flagged with a "Q" on the Laboratory Control Report. The control spike contains an abbreviated list of compounds in the method, and may contain compounds not on the target list for the specified report.

Laboratory Control Duplicate

The laboratory control duplicate is a duplicate analysis of the laboratory control spike, a standard, or a sample depending on the method. The results are reported as a relative percent difference (RPD). The criteria for the duplicate is in the Laboratory Control Report for the Daily Analytical Batch. Any results outside the control limits are flagged with a "Q" on the Laboratory Control Report.

Analytical Method Description(s)

Analytical Reports

Analytical Reports

EAS SDG Number: 225100

Project Number: 17807

The following pages contain the certified Analytical Reports for the samples submitted in the Sample Delivery Group (SDG) and are in order of the EAS Lab ID number. All of the analytical methods used are modifications of the published methods. Procedural method modifications, QC modifications, QC Criteria modifications, target lists, definitions of detection limits, and flags are all explained in detail in the EAS Quality Manual. The Analytical Report has columns for the method detection limit (MDL), the reporting limit (RL), and the Amount. The Amount is the concentration of the compound in the sample. The report usually has the results reported with two commonly used units. The MDL, RL, and Amount are adjusted for the canister dilution factor and any dilution caused by sample matrix effects.

NELAC CERTIFICATION

EAS is accredited by the National Environmental Laboratory Accreditation (NELAC) with the Florida Department of Health, one of the NELAC certifying states. EAS is certified for the EPA TO-15, EPA TO-11 and EPA TO-4 methods. A list of accredited compounds is available on request.

DETECTION LIMITS

MDL: The MDL is lowest concentration that can be measured to be statistically above the noise level and is determined using the EPA 2016 method which uses the standard deviation of replicate measurements made over time. The method also incorporates systematic instrumentation blank levels. See Quality Manual for detailed explanation.

RL: The reporting limit (RL) is the lowest concentration that can be reliably reported for each compound that meets the QC Criteria for the method, background levels, or project specific considerations. The QC criteria level for the method blank is to be less then the RL See Quality Manual for more information.

DATA FLAGS

In the standard report, if a compound is not detected above the method detection limit, a "ND" is in the Amount column. The flag column is used for both the not detect flag and for any data flags.

B - This compound was detected in the batch method blank above the reporting limit and is greater then one tenth the amount in the sample.

E - This compound exceeds the calibration range for this sample volume.

J - The amount reported is estimated because it was below the RL and could be below the lowest calibration point, have higher uncertainty, or could be the result of system background

SIGNIFICANT FIGURES

Based on the uncertainty in the methods, the numbers on the Analytical Reports should be used with only two significant digits. Additional significant figures are reported for ease of use and to avoid rounding errors when used in further calculations.

UNITS

PPBV or PPMV: Parts-per-billion (or million) by volume is a mole (volume) ratio of the moles of analyte divided by the moles of air (gas). This is the primary unit used to report air or gas concentrations and is independent of temperature and pressure.

UG/M3 OR MG/M3: The reported result was calculated based on 1 atm pressure and a temperature of 25C. The conversion from PPBV is: UG/M3 = PPBV x MW/24.46 where 24.26 is the gas constant and MW is the Compounds Molecular Weight (sometimes called Formula Weight)

Note: The Normal hydrocarbon is the last in the group. Nonane is the end of the C9 range
The compounds between Octane C8 and Noname C9 are considered C9
Note: This is not exact because is is violated for a couple of hydrocarbons (usualy trans) and aromatics.

Note: The Normal hydrocarbon is the last in the group. Nonane is the end of the C9 range
The compounds between Octane C8 and Noname C9 are considered C9
Note: This is not exact because is is violated for a couple of hydrocarbons (usualy trans) and aromatics.

Note: The Normal hydrocarbon is the last in the group. Nonane is the end of the C9 range
The compounds between Octane C8 and Noname C9 are considered C9
Note: This is not exact because is is violated for a couple of hydrocarbons (usualy trans) and aromatics.

Note: The Normal hydrocarbon is the last in the group. Nonane is the end of the C9 range
The compounds between Octane C8 and Noname C9 are considered C9
Note: This is not exact because is is violated for a couple of hydrocarbons (usualy trans) and aromatics.

Note: The Normal hydrocarbon is the last in the group. Nonane is the end of the C9 range
The compounds between Octane C8 and Noname C9 are considered C9
Note: This is not exact because is is violated for a couple of hydrocarbons (usualy trans) and aromatics.

C5 to C12	C5 to C12 Gasoline					**0**		Sum from	8.34	**to**	32

Note: The Normal hydrocarbon is the last in the group. Nonane is the end of the C9 range
The compounds between Octane C8 and Noname C9 are considered C9
Note: This is not exact because is is violated for a couple of hydrocarbons (usualy trans) and aromatics.

Note: The Normal hydrocarbon is the last in the group. Nonane is the end of the C9 range
The compounds between Octane C8 and Noname C9 are considered C9
Note: This is not exact because is is violated for a couple of hydrocarbons (usualy trans) and aromatics.

Note: The Normal hydrocarbon is the last in the group. Nonane is the end of the C9 range
The compounds between Octane C8 and Noname C9 are considered C9
Note: This is not exact because is is violated for a couple of hydrocarbons (usualy trans) and aromatics.

C12+	**C12+ as (Decane)**					**0**		Sum from	32.46	to	
	NOTE: THE SUM OF THE CARBON RANGES = TOTAL NMHC					**51842**					
C5 to C12	C5 to C12 Gasoline					**0**		Sum from	8.34	**to**	32

Note: The Normal hydrocarbon is the last in the group. Nonane is the end of the C9 range
The compounds between Octane C8 and Noname C9 are considered C9
Note: This is not exact because is is violated for a couple of hydrocarbons (usualy trans) and aromatics.

Note: The Normal hydrocarbon is the last in the group. Nonane is the end of the C9 range
The compounds between Octane C8 and Noname C9 are considered C9
Note: This is not exact because is is violated for a couple of hydrocarbons (usualy trans) and aromatics.
