1. Introduction

Background

The Chiquita Canyon Landfill (CCLF or Landfill) is a municipal solid waste (MSW) landfill located in northern Los Angeles County. An area of the Landfill is currently experiencing elevated gas temperatures and surface subsidence, with accompanying elevated gas generation, due to a subsurface reaction. This report is intended to provide an air emissions assessment (Test Event #4) to determine landfill surface air emissions for both the area of the Landfill affected by the reaction and areas not affected by the reaction. Th prior test events at the Landfill were conducted on:

1. August 29-31, 2023
2. March 19-21, 2024
3. November 19-21, 2024

The Fourth Test Event, which is described in this report, was conducted on March 19-21, 2025.

Site Location

The test site is Chiquita Canyon Landfill, which is located at 29201 Henry Mayo Drive, Castaic, California, 91384.

Figure 1.1 Site Location Map.

Facility Description

At the time of the Fourth Test Event, Chiquita Canyon Landfill was an inactive MSW disposal facility and was not receiving waste.

Objective

The objective of this emissions assessment was to quantify, by field measurement, the air emissions of fixed gases (including methane, carbon dioxide, and carbon monoxide), reduced sulfur compounds, and

speciated volatile organic compounds (VOCs) from the area of the Landfill affected by the reaction and areas not affected by the reaction.

Methodology

The Landfill's air emissions were directly measured using the U.S. Environmental Protection Agency (USEPA) Surface Emission Isolation Flux Chamber (flux chamber) following the USEPA User's Guidance document (see Photo 1.1). Whole air samples were collected from the flux chamber using Summa® canister and Tedlar® bags with analysis by the following methods:

- ASTM D-1945/USEPA Method 3C for fixed gases (including methane, carbon dioxide, and carbon monoxide);
- USEPA Method 3C for helium;
- South Coast Air Quality Management District (SCAQMD) Method 307-91 for hydrogen sulfide (H_2S)/organic reduced sulfur (ORS);
- USEPA Method TO-14 for speciated VOCs;
- USEPA Method TO-15 for speciated VOCs (including tentatively identified compounds); and
- USEPA Method TO-12 for total non-methane VOC with functional group/molecular weight distribution.

Flux from soil surfaces can either be diffusive (driven by molecular action), advective (driven by gas movement), or a combination of both. Given that it was expected that the landfill surface would have an advective flow at some or many locations, the flux chamber assessment included the use of a tracer (10% helium) in the chamber sweep air gas as per SCAQMD Rule 1133.3, Attachment A. The dilution of the tracer taken from the evacuated canister samples was used to calculate total flow in the flux chamber for the emissions assessment. Note that TO-12, TO-14, TO-15, USEPA Method 3C, and USEPA Method 3C samples were collected and analyzed from the same sample canister.

Landfill Surface Nomenclature

For the purposes of this test, the Landfill surface was divided into the following areas:

Non-Reaction Area

This is the portion of the Landfill that is not affected by the landfill reaction and that did not exceed the SCAQMD Rule 1150.1 integrated data limit of 25 parts per million by volume (ppmv) on February 18-19, 2025, the dates of the site-wide SEM event whose data was used to select the test cells.

Reaction Area

This is the portion of the Landfill designated as being affected by the landfill reaction by SCS Engineers' (SCS) staff, and that did not exceed the SCAQMD Rule 1150.1 integrated data limit on February 18-19, 2025 (Appendix 1).

Membrane Area

This is a subset of the Reaction Area that is covered with a HDPE membrane per Photo 1.2.

Photo 1.2 Flux Chamber on Membrane Covering Portion of Landfill.

Exceedance Area

This is the portion of the Landfill that was designated as being affected by the landfill reaction and that exceeded the SCAQMD Rule 1150.1 integrated data limit on February 18-19, 2025. This portion of the Landfill was considered separately to assess any impact of the grid cells that exceeded the Rule 1150.1 integrated data criteria would have on total site surface emissions. Note that these grid cells are subject to a strict remediation schedule, so elevated emissions from these cells would be a temporary phenomenon.

2. Sampling Scope

This study was focused on the assessment of air emissions from areas of the Landfill affected by the reaction and areas not affected by the reaction. Each Landfill area was tested using the flux chamber technology. Flux chamber measurement data performed at representative locations within grid cells was used to estimate the following constituents from the Landfill: VOCs-, sulfur compound-, toxic air contaminant (TAC)-, and fixed gas- emissions.

The completed scope of work for the emissions assessment is given below in Table 2.1.

3. Sampling Strategy

Selection of Sampling Locations

Sampling locations were selected based on SEM data obtained under the SCAQMD Rule 1150.1 SEM program. The SEM program consists of surveying the Landfill surface on a track using a field portable, calibrated instrument sensitive to methane and total non-methane hydrocarbon (TNMHC). The landfill grid pattern is shown in Figure 3.1. The grid cells over the areas of the Landfill affected by the reaction are highlighted. The grid cells that were sampled are enclosed in a geometric figure.

Test Cell Selection Methodology

This emissions assessment was conducted by analyzing Rule 1150.1 SEM data and categorizing the Landfill areas based on surface emissions. At this site, SEM events are conducted as often as every two weeks.

The SEM events are conducted using an instrument fit with a flame ionization detector (FID) along with global positioning system (GPS) location recording to map fugitive surface hydrocarbon concentrations following a pattern in each grid cell for the site. Instantaneous fugitive concentration data is determined by walking a serpentine path across each nominal 50,000 square foot (ft^2) Landfill grid cell. Integrated concentration data is determined by averaging the instrument readings obtained while traversing the serpentine path as illustrated in Figure 3.2.

Emissions concentration data and location information are collected and stored for the purpose of ranking grid cells on the Landfill by emissions concentration. The integrated concentration data was used to 'rank' the grid cells into categories of high emissions, medium emissions, and low emissions. The instantaneous fugitive concentration data was used to select representative locations for flux chamber testing where flux data for VOCs, sulfur, and toxic air contaminants was collected. The flux from these representative locations was used to estimate air emissions from the entire surface of these cells.

Tables 3.1 through 3.3 show the sorted integrated SEM data for the non-reaction area cells during the period of February 18-19, 2025. Table 3.4 shows the sorted integrated SEM data for the reaction area cells during the period of February 18-19, 2025. Table 3.5 shows the sorted integrated SEM data for the exceedance area cells during the period of February 18-19, 2025. The actual cell tested on each table is highlighted in yellow in Column 1.

The structure of Tables 3.1 through 3.5 is as follows:

- Column 1 is the grid cell number designation.
- Column 2 is the surface area of each grid cell (each grid cell is nominally 50,000 ft^2, but for this analysis, the exact area of each grid cell is used).
- Columns 3 are the integrated SEM values (FID response as ppmv methane) for the SEM event from February 18-19, 2025.
- Column 4 is the cumulative average of all the grid cells above the grid cell in question.
- Column 5 is the percentage-of-total of grid cell in the grid cell grouping. Targets are: 16.7% for the high group (this is the midpoint of the top 33% of the emissions that the high group represents), 50% for the medium group, and 83.3% for the low group.

The non-reaction area test cells (see Tables 3.1 through 3.3) were initially selected by organizing the integrated SEM data by average (Column 3) and splitting the resulting data into three categories: high emission, medium emission, and low emission. From there, the mean cell(s) from each group were initially selected for testing. These cells are highlighted in yellow in Tables 3.1 to 3.3 above.

A similar process was used for the reaction area test cells (see Table 3.4). One grid cell was selected to be tested from the exceedance area. This cell, highlighted in red, was just over the mean value of all the exceedance area grid cells. The non-exceedance reaction area test cells were initially selected by splitting the data into high, medium, and low emission groups. The mean cell(s) from each group were initially selected for testing. On Monday, March 18, 2025, the Landfill was evaluated for the final cell selection. This final selection process was necessary to verify whether a selected cell was accessible for testing or is otherwise not representative. For this test event, all the initially selected cells were suitable for testing. Note that while any cell can be tested and pro-rated using this methodology, the mean emissions cells were used because they should result in the most accurate results.

Selecting Test Points in a Cell

Using survey flags, the serpentine route prescribed by Rule 1150.1 was walked in a cell and FID readings were periodically noted on the planted flags and field screening data forms provided in Appendix 2.

Flux chamber samples were taken at the following target locations:

1. Highest Emission - Peak FID reading on serpentine walk.
2. High Emission - Mid-point of highest 10% of readings.
3. Medium Emission - Mid-point of the next 40% of readings.
4. Low Emission - Mid-point of lowest one half of readings.

Table 3.6 shows the selected test grid cells along with their area metrics.

4. Sampling Results

All sampling for the Fourth Test Event took place on March 19-21, 2025. Table 4.1 presents the sampling data for the key compounds: methane; and VOC (TNMHC). Complete data with quality assurance/quality control (QA/QC) commentary and calculations are provided in Attachment 1 (**Data Validation Technical Memorandum** [DVTM]). Location 1 represents the highest emission grid measurement, location 2 represents the high emission grid measurement, location 3 represents the medium emission grid measurement, and location 4 represents the low grid measurement.

Table 4.2 shows the calculated flux for the TO-15 compounds that were detected at least once in the data set. Non-detects were assumed to be MDL/2. Tables 4.3 and 4.4 show the results for TO-14 and ORS (SCAQMD Method 307-91) respectively. The complete list of all target compounds is provided in the DVTM. Tentatively identified compound (TIC) concentrations are shown in the lab reports.

5. Data Analysis

Cell Area Apportionment

Table 5.1 shows how the individual flux chamber data points were apportioned to calculate the average flux value for the test grid cell. Four measurements were made in each test cell. The four measurements were targeted to represent the low emission (bottom half), medium emission (between the bottom half and the top 10%), high emission (top 10%), and maximum screened concentration in the test cell. Therefore, the target low measurement represented 50% of the cell area, the medium measurement represented 40% of the cell area, the high measurement represented 10% of the cell area, and the maximum measurement represented the area of the flux chamber, 0.13 m^2. However, the actual values were substantially different than the target values. Table 5.1 shows the calculated apportionment values based on the analysis of interior cell screening. The calculation basis is provided in Appendix 2.

Table 5.1 Grid Cell Area Apportionment by Interior Grid Cell Zone.

The average flux value of the cell was calculated by multiplying the appropriate apportionment factor (see Table 5.1) by the measured flux value for each position. The maximum reading was assumed to be valid only under the flux chamber, an area of 0.13 m^2, because the maximum reading is only represented at one point of the grid. No other portion of the grid is represented by the maximum reading.

Emissions Calculations

All emissions calculations are provided in Appendix 3. As an example, the methane emissions calculation is provided below in Table 5.2. The flux values shown in Section 5 (for the four internal cell categories [low, medium, high, and max]) are averaged based on the area apportionment described above. That average cell flux value (column "W. Avg") is then multiplied by the area represented by that grid cell to arrive at the total emissions. Emissions were calculated and presented using the calculation methodology as stated in the test protocol. The highlighted data are flux values for test locations over the polymer membrane cover.

Carbon monoxide and hydrogen were not detected in any of the samples and were not otherwise quantified.

Tentatively identified compounds (TICs) are provided in the lab reports. Their detections were sparse, so we did not complete emission calculations for site-wide flux for these chemicals. However, upon request, TIC calculations could be provided.

Emissions Summary

Table 5.3 and 5.4 summarize the total site surface emissions in tons per year. Although the emissions data is presented in tons per year, it should be noted that these emission rates are only valid for the time-period during the sampling event and are not intended to imply that the emissions over the next 365 days would be equal to these values. All laboratory data that were reported as “not detected” were quantified at one-half the method detection limit (MDL) for the emissions calculations. The “Membrane Flux” is part of the total emissions and represents that part of the Total Emissions that come from the membrane – it is not additive.

In addition, the average flux rate for each compound is provided in mg/m2-min in each of the tables.

Data Based Observations

Overall Data Trend

Table 5.5 provides a comparison of site-wide emission rates (in tons/yr) for selected chemicals from the August 2023, March 2024, November 2024 and March 2025 flux chamber testing events. These data demonstrate that although there was a significant increase in emissions from the first to the second test, resulting from major upset conditions that occurred during the second test, the results of the third event, and even more for the Fourth Event, show a substantial decrease in emissions compared to the earlier events, for most of the species analyzed. This trend is likely a result of improvements in gas recovery and cover systems at the Landfill. Note that for most of the speciated compounds, the laboratory results were near or below the method detection limit. Therefore, there will likely be limited further reductions in quantifiable emissions for those compounds in future events due to the limitations of the performance of the chemical analysis for the gas samples.

Gas System Mitigation

One of the test cells (Grid Cell 197) was tested twice due to unfortunate suboptimal gas system operation whereby gas wells were taken offline in the grid cell after grid selection had already occurred, so the conditions were not the same as when the grid was selected for testing. Table 5.6 shows the before and after overall test results calculated using the as found condition (Normal Analysis or before) and mitigated gas system condition (Repeat Cell or after). The only species that seemed to be significantly impacted were methane and total VOC as highlighted in Table 5.6 below.

Method Detection Limit Calculation Assumptions

All officially reported emissions are calculated based on using one half of the method detection limit (MDL) for the concentration when a compound is not detected (ND = MDL/2). Table 5.7 shows the impact of this assumption by comparing the ½ MDL data to a calculation where a "Not Detected" compound is assumed to be a zero value (ND = 0). The emissions of the blue highlighted compounds are the most impacted by this assumption. Note that methyl mercaptan was never detected for this event. The emissions of almost all of the compounds are now being impacted by this ½ MDL assumption.

Membrane Emissions

Table 5.6 shows the membrane emissions as compared to the total emissions. As of this test event, the membrane covered area was 2,005,938 ft2 out of a total area of 12,900,697 ft2 or 15.5% of the total area. The compounds with the high percent membrane emissions may be permeable through the membrane. However, no hard conclusions can be made from this data since the sampling methodology as defined in the test protocol targets high accuracy on high emitting sources at the expense of accuracy for low emitting sources. This is due to the use of a buoyant tracer (helium) in the flux chamber. This issue can be resolved by using a neutrally buoyant tracer in the flux chamber which will provide high accuracy for all sources.

Emissions Distribution by Source Category

The emissions are computed by category, with the four categories being:

1. Exceedance Area
2. Reaction Area
3. Non-reaction Area
4. Non-SEM Area

Figure 5.1 shows distribution of emissions for the top speciated TO-15/307-91 compounds. This graph shows that emissions for dimethyl sulfide, benzene, and isopropanol are dominated by the emissions from the reaction area. Conversely, emissions for methanol, isopropyl mercaptan and propylene are dominated by the non-reaction area.

Trend Analysis of Individual Compounds and Compound Groups

Figure 5.2 shows the trend for total VOC by TO-12. It is gradually bottoming out after the steep decline between the Second and Third Events.

Figure 5.2 Total VOC for all Sampling Events.

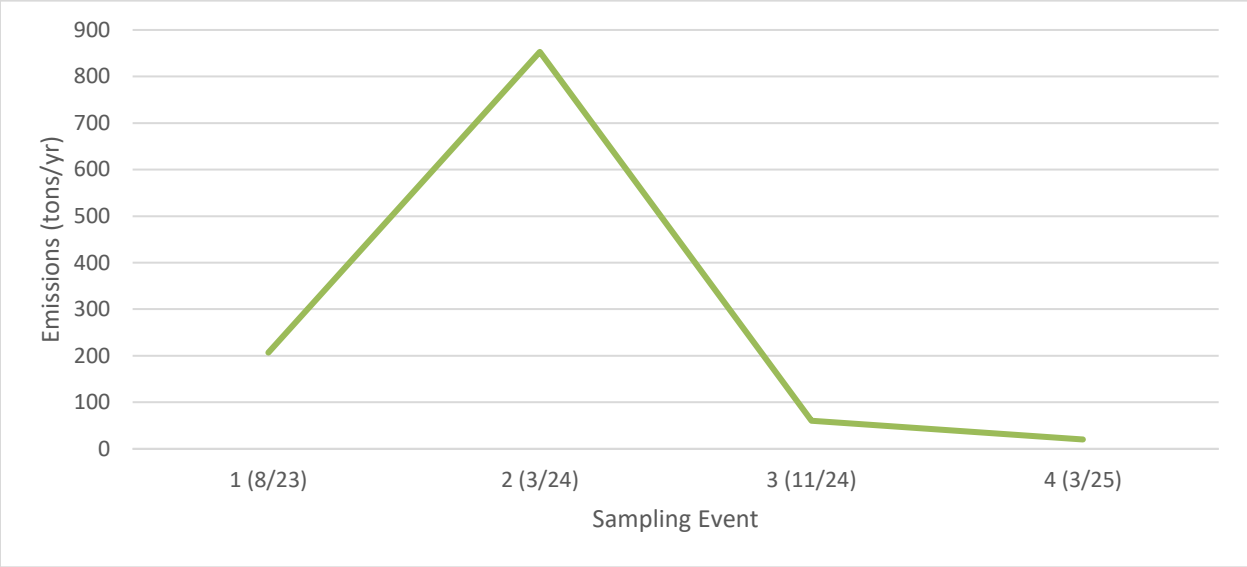

Figure 5.3 shows the trend for speciated toxic compounds. This figure shows that the toxic emissions are holding steady at a fairly low level between the Third and Fourth Events. The future toxic emissions will likely not deviate from the levels found during the Third and Fourth Events.

EXECUTIVE SUMMARY

This Technical Memorandum includes a discussion of the testing methodology, quality control procedures, and results of the flux data the from the March 2025 fourth air emissions testing event (Test Event #4).

Field measurements were conducted by landfill screening experts at the Chiquita Canyon Landfill (CCLF or Landfill) facility located at 29201 Henry Mayo Drive, Castaic, California in March 2025, to measure surface air emissions from the Landfill. Testing was performed using field screening for methane at the surface and following screening, in-depth area source testing using the U.S. Environmental Protection Agency (USEPA) Surface Emission Isolation Flux Chamber (flux chamber) technology as per the USEPA User's Guidance document protocol (February 1986). This USEPA document provides the guidance for constructing and operating an agency approved area source measurement technology. The average flux (in units of mass per time per unit area) of surface emissions were calculated per category of grid cell (i.e., low, medium, high, highest) per type of landfill area (i.e., reaction area and non-reaction area as defined in the Assessment of Air Emissions from Landfill Surfaces [Emissions Report]). When summed, these grid cell flux data multiplied by the number of grid cells in these categories represents the air emissions of compounds from the Landfill surface.

The methane surface screening was conducted in similar fashion as to the USEPA New Source Performance Standards (NSPS) Title 40 Code of Federal Regulations (CFR) Part 60.755 (c) and (d), and CFR Part 60, Appendix A, Method 21 and the surface emissions monitoring (SEM) requirements contained within the California AB 32 Landfill Methane Rule (LMR) under Title 17 California Code of Regulations. The screening used the same grid system as is used in the South Coast Air Quality Management District's (SCAQMD) Rule 1150.1 surface emissions monitoring, which consists of nominal one acre grid cells (approximately 50,000 square feet). A total vapor analyzer (TVA) instrument fit with a flame ionization detector (FID) was used along with a global positioning system (GPS) location recording to map fugitive surface emissions in each grid cell.

As described in the Emissions Report, methane screening was performed by recording data along a traverse pattern that is spaced at 25 feet over the Landfill grid cells. Concentration data and location information was collected and used to generate integrated screening concentration of each grid cell. Grid cells were then ranked and divided into three groups: low emission, medium emission, and high emission per study area (reaction area and non-reaction area). Grid cells were selected for testing as described in the Emissions Report. The selected grid cells were screened on a point-by-point basis. Representative low, medium, high, and the highest emission locations

The samples collected from the flux chamber for each location were used to calculate air emissions. The sample concentration data (mass per time) as received from the labs were reviewed, quality control (QC) data checks were performed, and tables were composed for total non-methane hydrocarbon compounds (TNMHC), hydrocarbon species, hazardous air pollutants (HAPs), sulfur containing compounds, fixed gases (CO2, hydrogen, CH4), and trace gas species helium (advective flow determination). This Technical Memorandum reports flux data for these study compounds along with QC evaluation. Emission estimates for the study compounds are provided in the Emissions Report.

I. INTRODUCTION

This technical memorandum describes the field testing that was conducted to characterize surface or fugitive air emissions. The CCLF site is located in Castaic, California. As discussed in more detail in the Emissions Report, testing was conducted on March 19-21, 2025 by Dr. C.E. Schmidt, Mr. Tom Card, Mr. Josh Abbey, and Mr. Rich Wharton supported by SCS Engineers sub-contractors, who performed landfill surface screening for methane prior to the test dates and during the testing program. Preparation for testing included submitting a Sampling Protocol (SP) in collaboration with SCS Engineers that was approved by SCAQMD. SCAQMD was present during the testing event.

The objective of the overall flux chamber study was to measure fugitive air emissions from grid cells that represented areas of the Landfill affected by the subsurface reaction (reaction areas) as well as from areas unaffected by the reaction (non-reaction areas), as defined in the Emissions Report. The study was conducted by selecting representative test locations and conducting quantitative analysis of air emissions producing representative air emissions data.

This memorandum includes a discussion of the testing methodology, quality control procedures, and results. This memorandum only reports flux data per study compound and location.

II. TEST METHODOLOGY

This section describes the methodologies used in the study for flux chamber testing, including evacuated canister and Tedlar® bag sample collection. Screening was performed in a fashion similar to the NSPS landfill screening protocol with additional criteria derived from the California Landfill Methane Regulation (LMR). Testing for surface flux was conducted using the USEPA recommended Surface Isolation Flux Chamber (flux chamber) (USEPA, Radian Corporation, February 1986). Flux chamber sampling was performed on pre-selected Landfill grids as described in the Emissions Report and as directed by the Sampling Plan (SP).

Flux Chamber Sampling

As described in the USEPA User's Guide (February 1986), the flux chamber is an environmental or portable chamber also known as a mixed-tank reactor that is used to measure the 'flux' (mass transfer of study compounds per surface area of area source per time). Ultra-high purity air (sweep air) from a compressed air cylinder is regulated and added to the flux chamber at a flow of 5 liters per minute (lpm) until the chamber contents are well mixed. The chamber is a 'vented' chamber which releases or exhausts the chamber gas through the pressure equalization port in the top of the chamber to the atmosphere which keeps the chamber contents at atmospheric pressure during the measurement. Chamber mixing is described by a number of 'residence times.' A residence time in the chamber is determined by dividing the chamber volume by the sweep air flow rate. Following the User's Guide and with a chamber volume of 30 liters, the residence time is 6 minutes. Proper mixing in the chamber is achieved after five residence times or 30 minutes. After mixing, or after the chamber contents (sweep air plus compounds emitted into the chamber) are at equilibrium, gas samples are collected per regulatory approved methods described in the SP. The flux of study compounds can be calculated (units of milligrams per square meter per minute, mg/m2,min) using the sweep air flow rate (5 lpm), the area of the flux chamber on the test site (0.13 square meters), and the concentration of the study compounds . This Technical Memorandum reports directly measured flux data for the study compounds used in the Emissions Report.

The basic operation of the flux chamber involved the following:

1. Identifying the test area or test surface
2. Initiating sweep gas flow rate to the flux chamber
3. Operating the chamber for at least five residence times (30 minutes)
4. Collecting sample gas from the chamber for analysis
5. Decontaminating the chamber
6. Relocating the measurement equipment to the next test area

CE Schmidt, Ph.D.
Environmental Consultant

The specific operating protocol for flux chamber sampling was as follows:

1. Locate the flux chamber, sweep gas, sample collection equipment, and field documents at the test location.
2. Document site information, location information, equipment information, name of sampler, date, and time on the Emissions Measurement Data Sheets. (provided in Attachment A.)
3. Place the chamber approximately 1/4 inch into test surface at the test locations selected as described in the Emissions Report. Seal the chamber along the base to prevent air infiltration, sealing on membrane cover using clean fill soil as a barrier to air flow. Place thermocouples to monitor soil and air temperature inside and outside of the chamber.
4. Initiate the sweep gas flow rate and set the rotometer at 5.0 lpm. Maintain a constant sweep gas flow rate. Record time.
5. Collect instrument background data (thermocouple) and other parameters (see Emissions Measurement Data Sheets in Appendix A) and record data.
6. Connect the purge pump to the chamber. Purge the sample line from the flux chamber without exceeding the line purge rate (or sample gas collection rate) of 2.5 lpm; this prevents entraining of ambient air into the chamber.
7. Operate the chamber sweep air flow rate at 5.0 lpm and record data every residence time (6 minutes) for five residence times or 30 minutes. Record the flow rate and time data. Maintain the chamber at steady state. Purge the sample line and Tedlar bags from the flux chamber with at least 10 line-volumes of air as part of the odor bag sampling protocol using the decompression lung device, preparing the sample line for the balance of the sample media collection.
8. Connect the sample media sequentially (sulfur bag, and evacuated canister) to the purged sample line and collect the gas sample. Do not exceed a collection rate of 2.5 lpm at any time to prevent unwanted dilution of chamber exhaust gas by ambient air. Both the odor and sulfur bags are purged prior to sample collection; the evacuated canister is not purged.
9. Label sample bag and record sample collection on the data sheet.
10. Store the sample(s) in the appropriate storage and/or shipping container as specified in the SP.
11. Document sample collection in field data sheets (see Attachment A).
12. Discontinue the flux measurement, shut off the sweep air, remove chamber, and secure equipment.

13. Decontaminate the chamber where contact was made with the liquid or solid material using a clean paper towel and water (if needed) to remove any soil and condensation from the inside of the chamber.
14. Relocate equipment to the next test location and repeat steps 1 through 13.

Tedlar® Bag Sampling
Grab samples using Tedlar® bags were collected from the flux chamber sample line at steady-state conditions (five residence times) for analysis for sulfur containing species. Sampling rate was maintained at less than 2.5 lpm from the flux chamber. Bag samples were collected by connecting the sampling line from the flux chamber using 1/4-inch Swage-lock® fittings fit inside the decompression lung or pressure fittings, drawing a vacuum on the decompression lung, and filling the Tedlar® bag. Both sulfur bags (a, b) were purged and evacuated prior to sample collection in order to minimize sample bag interaction. Note two Tedlar bags were collected for sulfur species analysis according to the method.

Canister Sampling
Grab samples using Summa® polished, evacuated stainless steel canisters were collected from the exhaust line of the flux chamber at steady-state conditions for speciation by gas chromatography. Sampling rate was maintained at less than 2.5 lpm from the flux chamber. Canister samples were collected by connecting the canister from the flux chamber sampling line using 1/4-inch Swage-lock® fittings, drawing a vacuum from and filling the canister. All canisters were batch certified by the laboratory according to USEPA Methods TO-15/TO-12/fixed gases/helium and sampled to full capacity (atmospheric pressure).

III. QUALITY CONTROL

Control procedures that were used to assure that data of sufficient quality resulted from the flux chamber study are listed and described below. The application and frequency of these procedures were developed to meet the program data quality objectives as described in the SP for all analytical methods used in this study. Method detection limits for all sample data are provided in the attached laboratory reports.

Field Documentation – A field notebook containing data forms, including sample chain-of-custody (COC) forms, was maintained for the testing program. Attachment A contains the Emissions Measurement Data Sheets.

Chain-of-Custody – COC forms were used for field data collection. Field data were recorded on the COC forms provided in Attachment B. Calibration records and certifications are found in

Total VOC as TNMNC by Analysis by USEPA Method TO-12, C1

Method QC Requirements – Method QC procedures were completed as per method requirements. These data are reported in the method specific lab reports (included as applicable in the footnotes of the lab report showing compliance with methods).

Laboratory Method Blank – A total of seven laboratory method blank samples were performed by the laboratory. TNHMC compounds were not detected in the blank samples at the method detection limit (MDL) level of about 30 ug/m^3. These data indicate acceptable method performance.

Laboratory Precision – A total of seven laboratory control duplicate (LCD) samples including nine compounds were performed by the laboratory. The LCD samples were reported within the criteria of less than 25%. These data indicate acceptable method performance.

Laboratory Accuracy – A total of seven laboratory control sample (LCS) or blank spike samples including nine compounds were performed by the laboratory. The LCS samples were reported within the criteria of 70-to-130 percent recovery. These data indicate acceptable method performance.

Field System Blank – Three media (field) blank samples were prepared in the field (T-118, T-214, T-310) and were analyzed as field samples (blind QC sample). All three field blank samples show non detect (MDL 32 ug/m3). These data demonstrate acceptable method performance.

Field Method Precision – Three field samples were collected in replicate (second sample taken immediately after the first sample for method precision data) and analyzed for the flux chamber testing (T-116/-117, T-212/-213, and T-308/-309). Only one of the three sample/replicate pairs showed detections above detection and the RPD value for TNMHC, C1 for this sample/replicate pair was 54 just over the criteria (QC criteria 50 RPD). With low detections of compounds found in this sample set, precision values exceeding criteria is not uncommon. These data do not indicate a systematic issue with precision for this method.

Laboratory Method Blank – A total of seven laboratory method blank samples were performed by the laboratory. Hydrocarbon compounds were not detected in the blank samples at the method detection limit (MDL) level of 1-to-1.2 ug/m^3. These data indicate acceptable method performance.

Laboratory Precision – A total of seven laboratory control duplicate (LCD) samples including nine compounds were performed by the laboratory. The LCD samples were reported within the criteria of less than 25%. These data indicate acceptable method performance.

Laboratory Accuracy – A total of seven laboratory control sample (LCS) or blank spike samples including nine compounds were performed by the laboratory. The LCS samples were reported within the criteria of 70-to-130 percent recovery. These data indicate acceptable method performance.

Field System Blank – Three media (field) blank samples were prepared in the field (T-118, T-2514, T-310) and were analyzed as field samples (blind QC sample). All three field blank samples show non detect (MDL 1.2-to-1.4 ug/m3). These data demonstrate acceptable method performance.

Field Method Precision – Three field samples were collected in replicate (second sample taken immediately after the first sample for method precision data) and analyzed for the flux chamber testing (T-116/-117, T-212/-213, and T-308/-309). Two sample/replicate pairs showed J values and a non detects and did not provide precision data. The third sample/replicate pair showed four data sets with RPD values for TNMHC ranging from of 6.7 to 66, with two sample/replicate pairs just exceeding criteria (QC criteria 50 RPD). Despite two exceedances of the four pairs and the non detects of compounds, these data do not indicate a systematic issue with precision.

Individual HAP Analysis by USEPA Method TO-15

Method QC Requirements – Method QC procedures were completed as per method requirements including recovery of surrogate compounds. These data are reported in the method specific lab reports.

Laboratory Method Blank – A total of five laboratory method blank samples were performed by the laboratory. Most compounds were not detected in the blank samples above the compound specific MDL levels (range of 1-to-15 ug/m^3). One of the five method blanks showed detects of four compounds ranging from 0.47 ug/m3-to-23 ug/m3. No compounds were detected in the field method blanks. These data indicate acceptable method performance.

Laboratory Precision – A total of five laboratory LCD samples including 18 compounds were performed by the laboratory. All LCD samples were reported within the criteria of less than 25%. These data indicate acceptable method performance.

Laboratory Accuracy – A total of five laboratory LCS samples including 18 compounds were performed by the laboratory. All LCS samples were reported within the criteria of 70-to-130 percent recovery. These data indicate acceptable method performance.

Field System Blank – Three media field blank samples were prepared in the field (T-118, T-214, T-310) and were analyzed as a field sample (blind QC sample). No compounds were detected above MDL (range of 0.65-to-11 ug/m^3) in the three field blank samples. These data demonstrate acceptable method performance.

Field Method Precision – Three field samples were collected in replicate and analyzed for the flux chamber testing (T-116/-117, T-212/-213, and T-308/-309). The sample/replicate pair T-116/-217 showed three compound pairs above reporting limits with a RPD range of 24-to-47; no compound pairs exceeded criteria. The sample/replicate pair T-212/-213 showed four compound pairs above reporting limits with a RPD range of 0.21-to-18; no compound pairs exceeded criteria. The sample/replicate pair T-308/-309 showed five compound pairs above reporting limits with a RPD range of 1.9-to-44; no compound pairs exceeded criteria. These data indicate acceptable method performance.

SCAQMD 307.91 Analysis for Hydrogen Sulfide

Method QC Requirements – Method QC procedures were completed as per method requirements. These data are reported in the method specific lab reports. Ten QC standard QC data sets were run in total on the samples for the instrument used in analyzing the samples; four runs on the first two batches each and two on the third batch of samples. In summary, the opening calibration verification standard and duplicate analysis QC (95%-105%, <5 RPD), method blank QC (<pql), standard and duplicate standard analysis QC (95%-105%, <10%), matrix spike/ QC (<10%), and closing calibration curve verification standard QC (90-110%) for both instruments used in the analyses were within the method requirements. These data indicate acceptable performance. Note that each sample was collected in duplicate (a, b) and samples indicated with a sample ID of 'a' were analyzed.

Field System Blank – Three media field blank samples were prepared in the field (S-118, S-214, S-310) and were analyzed as field samples (blind QC sample). Hydrogen sulfide/and other reduced sulfur compounds were not detected in the three blank samples at a level of 0.005 ppmv. These data demonstrate acceptable method performance.

Field Method Precision – Three field samples were collected in replicate and analyzed for the flux chamber testing (S-116/-117, S-212/-213, and S-308/-309). In each case, sample and replicate pair, both were non-detect for all three pairs, thus no information could be obtained regarding precision for the method. However, the laboratory precision data was acceptable. These data indicate acceptable method performance.

ASTM 1945/USEPA 3C for Fixed Gases (methane and carbon dioxide)
Method QC Requirements – Method QC procedures were completed as per method requirements.

Laboratory Method Blank – One laboratory method blank sample was performed by the laboratory. Fixed gases were not detected in the blank samples above the MDL that ranged between 0.01% to 0.05%. These data indicate acceptable method performance.

Laboratory Precision – One LCD sample was performed by the laboratory. The LCD sample was reported within the criteria of less than 25%. These data indicate acceptable method performance.

Laboratory Accuracy – One LCS sample wase performed by the laboratory. The LCS sample was reported within the criteria of 70-to-130 percent recovery. These data indicate acceptable method performance.

Field System Blank (accuracy) – Three media (field) blank samples were prepared in the field (T-118, T-214, T-310) and were analyzed as field samples (blind QC sample). Carbon dioxide and methane were both not detected above the method detection limit (0.05 ppmV methane and 0.01% carbon dioxide). These data demonstrate acceptable method performance.

Field Method Precision – Three field samples were collected in replicate and analyzed for the flux chamber testing (T-116/-117, T-214/-515, and T-308/-309). Two of the sample replicate pairs for carbon dioxide had a RPD of 0.0 and the third was 25 RPD (criteria RPD 50). Likewise two of the sample replicate pairs for methane had a RPD of 0.0 and the third was 43 RPD (criteria RPD 50). These data indicate acceptable method performance.

ASTM D1945 for Helium (trace gas detection)
Method QC Requirements – Method QC procedures were completed as per method requirements.

Laboratory Method Blank – A total of one laboratory method blank sample was performed by the laboratory. Helium was not detected in the blank samples at the MDL of 0.02%. These data indicate acceptable method performance.

CE Schmidt, Ph.D.

Laboratory Precision – One LCD sample was performed by the laboratory. The LCD sample was reported within the criteria of less than 25%. These data indicate acceptable method performance.

Laboratory Accuracy – One LCS sample was performed by the laboratory. The LCS sample was reported within the criteria of 70-to-130 percent recovery. These data indicate acceptable method performance.

Field System Blank – Three media field blank samples were prepared in the field (T-118, T-214, T-314) and were analyzed as field samples (blind QC sample). Given that these blank samples were taken from a calibration standard gas, these data serve as accuracy data or sample recovery QC data (±30%). The range of percent recovery for the three samples was 88.7%-to-99.4%. These data demonstrate acceptable method performance.

Field Method Precision – Three field samples were collected in replicate and analyzed for the flux chamber testing (T-116/-117, T-212/-213, and T-308/-309). The RPD values ranged from 3.8-to-5.8 (QC criteria (50 RPD). These data indicate acceptable method performance.

Field Calibration of the TVA-1000; Screening for Total Hydrocarbon Concentration

Pre-Use and Post-Use Instrument Response to Span (calibration) Gas and Zero Air (pure air)

The TVA-1000 instrument with an FID detector was pre-use and post-use calibrated each day of use using certified methane span gas standard at 100 ppmv. Zero air checks were generally acceptable, and all span checks were within 70%-to-130% accuracy, indicating acceptable instrument performance. The cold morning startups did cause higher blank levels and recalibration during the day as the ambient temperature increased, however the instrument did provide useful screening data. The instrument also came with a photo ionization detector (PID) detector but was not used for the screening activities. No field data (TVA FID or PID) were used in the emissions calculations; these data were only used in the field for directive purposes.

Field Calibration of the J-631X; Screening for Hydrogen Sulfide

Pre-Use and Post-Use Instrument Response to Zero Air

The two J-631X hydrogen sulfide analyzers were pre-use and post-use zero air checked and re-zeroed without incident. These field screening instruments performed well as compared to pre and post zero air checks. The cold morning startups did cause higher blank levels and high/low response recalibration during the day as the ambient temperature increased, however the instrument did provide useful screening data. Each analyzer seemed to have different sensitivity, and measurements were performed and recorded for both analyzers. No field data (J-631X) were used in the emissions calculations; these data were only used in the field for directive purposes.

IV. RESULTS AND DISCUSSIONS

A summary of the field sample collection information and field data for the field testing is shown in Table 1. Note that one grid (#197) was retested because it was learned that evening activities (work on the gas collection system) had occurred in that area. As such an addition testing event was conducted on Gird #197. All field data for the surface flux chamber testing and sample identification information are presented in Table 2. Table 2 provides both concentration (%, mg/m^3, DT) and flux (mg/m^2,min, DT/m2,min) data. All laboratory data, including quality control data, are presented in Attachment C to this memorandum. TO-15 data is presented in Table 3, TO-14 data is presented in Table 4, and SCAQMD 307-91 data is presented in Table 5.

Surface flux data are shown in flux units for compound emissions (mg/m^2,min and DT/m2,min). Surface flux for a surface area source is calculated using measured target compound concentrations/odor DT and flux chamber operating parameter data (sweep air flow rate of 5.0 lpm [or 0.005 cubic meters per minute (m^3/min) plus advective flow], surface area of 0.13 square meters [m^2]). The site emissions can be calculated by multiplying the flux by the surface area of the grid cell or source tested. The flux (Fi, mg/m2,min or DT/m2,min) is calculated from the sweep air flow rate (Q, m^3/min)), the compound concentration (Yi, mg/m^3 or DT), and exposure to the chamber surface area (A, m^2)), as follows:

$$Fi = (Q)\ (Yi) / (A)$$

Emission rate (mass per time) from a source tested using the flux chamber technology can be obtained by multiplying unit or average flux data per compound by the surface area of the source. Note that advective flow at each test location was determined by the dilution of the 10% helium trace gas as is the protocol for SCAQMD Rule 1133.3, Attachment A.

The flux of VOCs as TNMHC, HAPs compounds, hydrocarbon species, sulfur containing compounds, and fixed gases (methane, hydrogen, and carbon dioxide) from the landfill grid cells tested is provided in this Technical Memorandum and is used in the Emissions Report.

The data set met the QC requirements provided in the SP and the laboratory methods employed.

V. SUMMARY

A focused air emissions assessment was performed on the CCLF at the facility located in Castaic, California. Areas of the Landfill that were tested included grid cells representative of both areas of the Landfill affected by the reaction and areas of the Landfill not affected by the reaction.

CE Schmidt, Ph.D.

Surfaces in the reaction area that were covered with a synthetic membrane were also tested as the technical approach included those grid cells by SEM screening like other grid cells on site. The following is a summary of activities and results associated with this Technical Memorandum:

- Surface flux measurements of VOCs as TNMHC, hydrocarbon species, HAPs compounds, sulfur containing compounds, and fixed gases (methane, carbon dioxide, helium) were measured on nine selected landfill grid cells; two grid cells were tested twice for field QC compliance (comparison purposes) or representativeness. Four flux chamber measurements were taken from each grid cell.

- Grid selection was based on the areas of interest (i.e., reaction area and non-reaction area) and methane surface screening data.

- Emissions testing was performed using the USEPA recommended surface flux chamber technology as described in the USEPA User's Guide for assessing fugitive air emissions from area sources. Surface advective flow was determined at each location by the dilution of a trace gas (10% helium) used as the chamber sweep air. Study compounds were tested following regulatory approved sampling and analytical methods. These technologies were used to quantitatively measure flux at the test surface of the listed study compounds.

- Field and laboratory quality control data indicate acceptable data quality for all of the analytical methods used. Lab method samples and media/field blank levels for the analytical methods were found to be acceptable according to the methods used. Method precision for the lab replicates and spike samples (LCD and LCS) met the method criteria. Field method blank samples and field replicate samples were also acceptable however some field precision exceeded criteria. This was likely due to the low levels found in many samples. The data set is of acceptable data quality for the purpose of assessing compound emissions from the landfill.

- The flux data generated in this field study can be used to estimate emission factors from the landfill area sources tested.

Project Sample Media

SDG Number: 225100

The following sample media was used for this Sample Delivery Group (SDG). The Sample Media column identifies the type of media. For canisters, the Sample Media Batch gives the canister number followed by the cleaning batch number, which is a unique identification. The initial pressure of the canister when it is received is recorded. If the canister is not pressurized, the final pressure will be the same as the initial pressure. If the canister is pessurized the final pressure will be recorded, and the canister dilution factor is calculated as the ratio of the final to initial pressure. The results are adjusted for the can dilution factor.

Laboratory Case Narrative

EAS SDG Number: 225100 **Project Number:** 17807

Client: C.E. Schmidt

The Laboratory Case Narrative for the SDG is below. The Chain of Custody form(s) follow the Laboratory Case Narrative.

Sample Control Narrative

The samples were all received in good condition and with proper preservation.

Analytical Methods

The methods used for sample analysis are listed on the Analytyical Report header, and have been modified as described in the EAS Quality Manual..

Case Narrative

QC Narrative

All analyses met EAS method criteria as defined in the Quality Manual, except as noted in the report or QC reports with data qualifiers.

Subcontract Narrative

No sample analysis was subcontracted for this project

Laboratory Certification

I certify that this data package is in compliance with the terms and conditions of the contract, both technically and for completeness other than the condition(s) noted above. The Laboratory Report is property of EAS and its client. The entire report has been reviewed and approved.

Date Approved: 4/15/2025

Section 2 Quality Control

This section contains the QC Reports for each Daily Analytical Batch (DAB) which make up the Sample Delivery Group (SDG). It also contains either the EAS or Project QC criteria that was used for the DAB. The methods used for this project have been modified from the original method. The modifications include modifications to the QC for the method. This is either because the method did not specify certain aspects of the QC, the method was originally designed for a different matrix, or additional compounds were added to the target list of the method which required modified QC. The QC modifications used by EAS follows those used by other air testing laboratories.

The Daily Analytical Batch data was checked against the QC criteria for the method. Any deviations from the QC criteria are listed on the QC Reports for each DAB, which are summarized in this section and are given in more detail in Section 4 which has the Quantitation Reports and Calculations for the Samples, Method Blank, Lab Control Spikes, as well as the Initial Calibration and Continuing Calibration. This section contains the following:

QC Narrative

Samples were anlayzed in a daily analytical batch (DAB) designated by a QC batch number, and were analyzed using EAS standard laboratory QC specified in the EAS Quality Manual which may be different then the referrenced agency method. Any deviations from the EAS QC criteria are flagged in the Laboratory Control Reports or in the sample Analytical Reports.

Standard Laboratory QC Report

Unless project specific QC was requested, this Section containing the standard laboratory QC (Level 2) supplied with the Analytical Reports. Each sample is analyzed in a Daily Analytical Batch (DAB) which includes the method blank, a laboratory control spike (LCS) and a laboratory control duplicate (LCD). A Daily Analytical Batch QC report is supplied for each method requested.

Method Blank

The method blank is a laboratory generated sample which assesses the degree to which laboratory operations cause a false positive. The target analytes in the analytical reports for a daily analytical batch are "B" flagged if their concentrations are present in the Method Blank above the RL, unless the result is greater then ten times the blank value..

Laboratory Control Spike

A laboratory control spike is a well characterized matrix similar to the sample which is spiked and run in duplicate with each Daily Analytical Batch. The laboratory control spike results are reported as a percent recovery. The QC Criteria for the control spike is listed in the Laboratory Control Report. Any results outside the control limits are flagged with a "Q" on the Laboratory Control Report. The control spike contains an abbreviated list of compounds in the method, and may contain compounds not on the target list for the specified report.

Laboratory Control Duplicate

The laboratory control duplicate is a duplicate analysis of the laboratory control spike, a standard, or a sample depending on the method. The results are reported as a relative percent difference (RPD). The criteria for the duplicate is in the Laboratory Control Report for the Daily Analytical Batch. Any results outside the control limits are flagged with a "Q" on the Laboratory Control Report.

Section 3 Analytical Methods

This section has information on the analytial methods and a copy of the analytical reports for the Sample Delivery Group (SDG) listed below. The reports are organized in order of the EAS Laboratory Number.

Analytical Method Description(s)

Analytical Reports

Analytical Reports

EAS SDG Number: 225100

Project Number: 17807

The following pages contain the certified Analytical Reports for the samples submitted in the Sample Delivery Group (SDG) and are in order of the EAS Lab ID number. All of the analytical methods used are modifications of the published methods. Procedural method modifications, QC modifications, QC Criteria modifications, target lists, definitions of detection limits, and flags are all explained in detail in the EAS Quality Manual. The Analytical Report has columns for the method detection limit (MDL), the reporting limit (RL), and the Amount. The Amount is the concentration of the compound in the sample. The report usually has the results reported with two commonly used units. The MDL, RL, and Amount are adjusted for the canister dilution factor and any dilution caused by sample matrix effects.

NELAC CERTIFICATION

EAS is accredited by the National Environmental Laboratory Accreditation (NELAC) with the Florida Department of Health, one of the NELAC certifying states. EAS is certified for the EPA TO-15, EPA TO-11 and EPA TO-4 methods. A list of accredited compounds is available on request.

DETECTION LIMITS

MDL: The MDL is lowest concentration that can be measured to be statistically above the noise level and is determined using the EPA 2016 method which uses the standard deviation of replicate measurements made over time. The method also incorporates systematic instrumentation blank levels. See Quality Manual for detailed explanation.

RL: The reporting limit (RL) is the lowest concentration that can be reliably reported for each compound that meets the QC Criteria for the method, background levels, or project specific considerations. The QC criteria level for the method blank is to be less then the RL See Quality Manual for more information.

DATA FLAGS

In the standard report, if a compound is not detected above the method detection limit, a "ND" is in the Amount column. The flag column is used for both the not detect flag and for any data flags.

B - This compound was detected in the batch method blank above the reporting limit and is greater then one tenth the amount in the sample.

E - This compound exceeds the calibration range for this sample volume.

J - The amount reported is estimated because it was below the RL and could be below the lowest calibration point, have higher uncertainty, or could be the result of system background

SIGNIFICANT FIGURES

Based on the uncertainty in the methods, the numbers on the Analytical Reports should be used with only two significant digits. Additional significant figures are reported for ease of use and to avoid rounding errors when used in further calculations.

UNITS

PPBV or PPMV: Parts-per-billion (or million) by volume is a mole (volume) ratio of the moles of analyte divided by the moles of air (gas). This is the primary unit used to report air or gas concentrations and is independent of temperature and pressure.

UG/M3 OR MG/M3: The reported result was calculated based on 1 atm pressure and a temperature of 25C. The conversion from PPBV is: UG/M3 = PPBV x MW/24.46 where 24.26 is the gas constant and MW is the Compounds Molecular Weight (sometimes called Formula Weight)

EPA Method TO-15 Modified Full Scan GC/MS

SDG: 225100

Analytical Method: TO-15

Laboratory ID: 32

File Name: 2510032A.D
Description: T-214
Canister: 610
QC_Batch: 033125-MA1

Date Sampled: 03/20/25 **Time:** 12:57
Date Analyzed: 03/31/25 **Time:** 13:08
Can Dilution Factor: 1.11
Air Volume: 300 ml

Section 4 Data Package

This section contains the Data Packages for the samples, blanks, and calibration. Each package has the analytical report, quantitation report, calculation sheet, instrument quantation report, and chromatograms.

Items provided in Data Package:

DAB Run Logs and Preparation Logs

Sample Packages

Blank Package for each Daily Analytical Batch

Quality Control Reports, LCS,LCD for each Daily Analytical Batch

Continuing Calibration Package for Each Daily Analytical Batch

Initial Calibration Data

DAB Run Logs and Preparation Logs

Samples are analyzed in a Daily Analytical Batch (DAB) on an instrument.
The DAB identifier is on each analytial report in the field called QC Batch.
This section contains the DAB Log Sheets and Preparation Logs.

WE WILL NEED A DATA PACKAGE:
TO-15 Full List - Process with BAQMD 95 Excel Template + Acrolein (some projects)
TO-12 TNMHC Process with Detailed Hydrocarbon Analysis Template - Report TNMHC C2-C12
ASTM D1945 Helium Carrier Gas - Run Permanent Gas List including H2. Normaliaze for N2 result
ASTM D1945 Helium and Hydrogen Confirmation - Check to see if there is a singnificant H2 peak if so process and add to Helium template

TO-15 Full List - Process with BAQMD 95 Excel Template
TO-12 TNMHC Process with Detailed Hydrocarbon Analysis Template - Report TNMHC C2-C12

Sample Calculation:

1) Avg RFn = Sum (Astdni) (Cistdi) / (Cstdni) (Aistdi) i — Note: 1

2) Raw Amt = (Ansamp) (Cistdi) / (Avg RFn) (Aistdi) = **Cn**

3) Amount ppbv = (Raw Amt) 1000 (CDF) / (SV)

4) Amount ug/m3 = (amt(ppbv) MW / 24.42

Sample Calculation:

1) Avg RFn = Sum [(Astdni) (Cistdi) / (Cstdni) (Aistdi)] i — Note: 1

2) Raw Amt = (Ansamp) / (Avg RFn) × (Cistdi) / (Aistdi) = **Cn**

3) Amount ppbv = (Raw Amt) × 1000 / (SV) × (CDF)

4) Amount ug/m3 = (amt(ppbv) × MW) / 24.42

SDG:		**2E+05**	
Laboratory Number:		**06**	
Standard Volume	STV	10.0	ml
Sample Volume	SV	300	ml
Can Dilution Factor	CDF	1.23	
Gas Constant		24.42	
Decimal Places:		2	

Sample Calculation:

1) Avg RFn = Sum [(Astdni) (Cistdi) / (Cstdni) (Aistdi)] i — Note: 1

2) Raw Amt = (Ansamp) (Cistdi) / (Avg RFn) (Aistdi) **= Cn**

3) Amount ppbv = (Raw Amt) 1000 (CDF) / (SV)

4) Amount ug/m3 = (amt(ppbv) MW / 24.42

SAMPLE CALCULATION

EPA Method TO-15 Modified Full Scan GC/MS

SDG:		**2E+05**	
Laboratory Number:		**07**	
Standard Volume	STV	10.0	ml
Sample Volume	SV	300	ml
Can Dilution Factor	CDF	1.23	
Gas Constant		24.42	
Decimal Places:		2	

Sample Calculation:

1) Avg RFn = Sum [(Astdni) (Cistdi) / (Cstdni) (Aistdi)] i — Note: 1

2) Raw Amt = (Ansamp) (Cistdi) / (Avg RFn) (Aistdi) = **Cn**

3) Amount ppbv = (Raw Amt) 1000 (CDF) / (SV)

4) Amount ug/m3 = (amt(ppbv) MW / 24.42

SDG:		**2E+05**	
Laboratory Number:		**08**	
Standard Volume	STV	10.0	ml
Sample Volume	SV	5	ml
Can Dilution Factor	CDF	1.26	
Gas Constant		24.42	
Decimal Places:		1	

Sample Calculation:

1) Avg RFn = Sum [(Astdni) (Cistdi) / (Cstdni) (Aistdi)] i — Note: 1

2) Raw Amt = (Ansamp) (Cistdi) / (Avg RFn) (Aistdi) **= Cn**

3) Amount ppbv = (Raw Amt) 1000 (CDF) / (SV)

4) Amount ug/m3 = (amt(ppbv) MW / 24.42

Sample Calculation:

1) Avg RFn = Sum [(Astdni) (Cistdi) / (Cstdni) (Aistdi)] i — Note: 1

2) Raw Amt = (Ansamp) / (Avg RFn) × (Cistdi) / (Aistdi) = **Cn**

3) Amount ppbv = (Raw Amt) × 1000 / (SV) × (CDF)

4) Amount ug/m3 = (amt(ppbv) × MW / 24.42

Can Dilution Factor	CDF	1.23	
Gas Constant		24.42	
Decimal Places:		2	

Sample Calculation:

1) Avg RFn = Sum (Astdni) (Cistdi) / (Cstdni) (Aistdi) i — Note: 1

2) Raw Amt = (Ansamp) (Cistdi) / (Avg RFn) (Aistdi) **= Cn**

3) Amount ppbv = (Raw Amt) 1000 (CDF) / (SV)

4) Amount ug/m3 = (amt(ppbv) MW / 24.42

Sample Calculation:

1) Avg RFn = Sum [(Astdni) (Cistdi) / (Cstdni) (Aistdi) i] Note: 1

2) Raw Amt = (Ansamp) / (Avg RFn) × (Cistdi) / (Aistdi) = **Cn**

3) Amount ppbv = (Raw Amt) × 1000 / (SV) × (CDF)

4) Amount ug/m3 = (amt(ppbv) × MW / 24.42

SAMPLE CALCULATION

EPA Method TO-15 Modified Full Scan GC/MS

SDG:		**2E+05**
Laboratory Number:		**15**
Standard Volume	STV	10.0 ml
Sample Volume	SV	300 ml
Can Dilution Factor	CDF	1.27
Gas Constant		24.42
Decimal Places:		2

Sample Calculation:

1) Avg RFn = Sum $\frac{(Astdni)\ (Cistdi)}{(Cstdni)\ (Aistdi)}$ Note: 1 i

2) Raw Amt = $\frac{(Ansamp)\ (Cistdi)}{(Avg\ RFn)\ (Aistdi)}$ = **Cn**

3) Amount ppbv = $\frac{(Raw\ Amt)\ 1000\ (CDF)}{(SV)}$

4) Amount ug/m3 = $\frac{(amt(ppbv)\ MW}{24.42}$

Sample Calculation:

1) Avg RFn = Sum [(Astdni) (Cistdi) / (Cstdni) (Aistdi)] i — Note: 1

2) Raw Amt = (Ansamp) (Cistdi) / (Avg RFn) (Aistdi) **= Cn**

3) Amount ppbv = (Raw Amt) 1000 (CDF) / (SV)

4) Amount ug/m3 = (amt(ppbv) MW / 24.42

SAMPLE CALCULATION

EPA Method TO-15 Modified Full Scan GC/MS

SDG:		**2E+05**
Laboratory Number:		**22**
Standard Volume	STV	10.0 ml
Sample Volume	SV	300 ml
Can Dilution Factor	CDF	1.18
Gas Constant		24.42
Decimal Places:		2

Sample Calculation:

1) Avg RFn = Sum [(Astdni) (Cistdi) / (Cstdni) (Aistdi)]$_i$ Note: 1

2) Raw Amt = (Ansamp) (Cistdi) / (Avg RFn) (Aistdi) **= Cn**

3) Amount ppbv = (Raw Amt) 1000 (CDF) / (SV)

4) Amount ug/m3 = (amt(ppbv) MW / 24.42

Sample Calculation:

1) Avg RFn = Sum (Astdni) (Cistdi) / (Cstdni) (Aistdi) i — Note: 1

2) Raw Amt = (Ansamp) (Cistdi) / (Avg RFn) (Aistdi) **= Cn**

3) Amount ppbv = (Raw Amt) 1000 (CDF) / (SV)

4) Amount ug/m3 = (amt(ppbv) MW / 24.42

SAMPLE CALCULATION

EPA Method TO-15 Modified Full Scan GC/MS

SDG:		**2E+05**
Laboratory Number:		**29**
Standard Volume	STV	10.0 ml
Sample Volume	SV	300 ml
Can Dilution Factor	CDF	1.29
Gas Constant		24.42
Decimal Places:		2

Sample Calculation:

1) Avg RFn = Sum $\left|\frac{(Astdni)}{(Cstdni)}\right| \left|\frac{(Cistdi)}{(Aistdi)}\right|_i$ Note: 1

2) Raw Amt = $\frac{(Ansamp)}{(Avg\ RFn)} \frac{(Cistdi)}{(Aistdi)}$ **= Cn**

3) Amount ppbv = (Raw Amt) $\frac{1000}{(SV)}$ (CDF)

4) Amount ug/m3 = (amt(ppbv) $\frac{MW}{24.42}$
