

15 de agosto de 2025

Karen Gork
Jefa Especialista en Salud Ambiental
Agencia de Cumplimiento Local del Condado de Los Ángeles
5050 Commerce Drive
Baldwin Park, California 91706

Asunto: Informe Mensual de julio de 2025 Conforme a los Objetivos 1A-3 y 5 de la Orden de Cumplimiento de la LEA del 6 de junio de 2024 y a la Carta del 30 de julio de 2024, Vertedero de Chiquita Canyon, Castaic, California

Estimada Sra. Gork:

SCS Engineers (SCS), en nombre de Chiquita Canyon, LLC (Chiquita), mediante el presente le proporciona al Programa de Gestión de Desechos Sólidos del Departamento de Salud Pública del Condado de Los Ángeles, que actúa como Agencia de Cumplimiento Local (LEA), un informe mensual, en cumplimiento con los Objetivos 1A-3 y 5 de la Orden de Cumplimiento de la LEA con fecha 6 de junio de 2024 (Orden de Cumplimiento) y la correspondencia posterior relacionada recibida de la LEA. Este informe abarca el período mensual de julio de 2025.

Chiquita Canyon Landfill (CCL o el Vertedero) es un vertedero/centro de disposición de desechos sólido, ubicado en 29201 Henry Mayo Drive en Castaic, California. Con relación al Vertedero, Chiquita opera un sistema de recolección y control de biogás. SCS elaboró y presentó el Informe Resumido sobre las Lecturas de Monóxido de carbono e Hidrógeno (Informe Resumido) a la LEA el 6 de junio de 2024 en nombre de Chiquita, en respuesta a las directivas indicadas en las cartas de la LEA con fecha 5 de abril de 2024 y 28 de mayo de 2024, sobre la toma de datos de biogás y conforme al Objetivo 1A-2 de la Orden de Cumplimiento. La LEA, en colaboración con el Departamento de Recursos, Reciclaje y Recuperación de California (CalRecycle), revisó el Informe Resumido y determinó que cumplía con el Objetivo 1A-2. La LEA estableció varios requerimientos nuevos para que Chiquita cumpla con el Objetivo 1A-3 en la correspondencia de seguimiento con fecha 30 de julio de 2024.

Este informe fue elaborado según los Objetivos 1A-3 y 5 de la Orden de Cumplimiento, la correspondencia de seguimiento de la LEA con fecha 30 de julio de 2024, la carta de Chiquita con fecha 3 de septiembre de 2024, la reunión del 12 de septiembre de 2024 con la LEA y la correspondencia de seguimiento de la LEA con fecha 19 y 27 de noviembre y 3 de diciembre de 2024.

Puntos de Cumplimiento con el Objetivo 1A-3

1. Presentar los resultados de los análisis de laboratorio de las muestras mensuales de monóxido de carbono (CO) e hidrógeno (H₂) tomadas de un set de pozos de biogás (LFG) seleccionados por la LEA. Consulte en la Tabla 1, las columnas rotuladas "CO" y "H₂".

Los resultados de los pozos monitoreados se muestran en el **Adjunto A**.¹ Los datos se están presentando a la LEA en un informe independiente firmado por un ingeniero matriculado, conforme al Objetivo 1A-3 de la Orden de Cumplimiento. Como se indicó en correspondencias previas de Chiquita y en los informes mensuales, este informe no incluye datos de los pozos CV-100, CV-1420, CV-1532, CV-2202, H-1774S, TC-2385A y TC-2385S, ya que esos pozos fueron abandonados, ni del pozo CV-2332, ya que ese pozo no se instaló nunca. Todos los demás pozos se evaluaron durante el mes de julio de 2025.

Como se trató en la reunión del 12 de septiembre de 2024 y como se informó previamente, los gráficos que muestran las tendencias de CO y H₂ se proporcionan en el **Adjunto D** y se tratan en mayor detalle a continuación.

2. Proporcionar datos de lecturas de gases fijos (CH₄, O₂ y CO₂) entre un set de pozos de LFG seleccionado por la LEA. Consulte en la Tabla 1 la columna rotulada "Gas Fijo CH₄, O₂, CO₂".

Los resultados de los pozos monitoreados se proporcionan en el **Adjunto A**.

3. Tomar temperaturas pozo abajo en 34 pozos, para confirmar las lecturas de las temperaturas de los cabezales de los pozos de gas según el requerimiento de los Estándares de Rendimiento de Fuentes Nuevas (NSPS). Consulte en la Tabla 1 en la columna rotulada "Monitoreo de Temperatura Pozo Abajo".

Chiquita entiende de la correspondencia de la LEA del 27 de noviembre de 2024 y como se indica en los informes mensuales previos, que en este momento solo debe tomar muestras de los pozos a la frecuencia anual indicada en los protocolos NSPS, pero que la LEA podrá requerir monitoreos más frecuentes de hasta diez (10) pozos seleccionados por la LEA. Chiquita está a la espera de la selección de la LEA de esos pozos.

Chiquita proporciona de todos modos en el **Adjunto B** los gráficos de las temperaturas pozo abajo² relacionados con los siguientes pozos, desde lugares fijos, que contienen el Sistema de Bombeo Lorentz con los sensores de temperatura integrales: CV-2315, CV-2350, CV-2351, CV-24017 y CV-24065

Se debe tener en cuenta que la bomba Lorentz y/o el sistema de monitoreo de temperatura de las bombas en CV-2301, CV-2302, CV-2303, CV-2352 y CV-24095 actualmente están fuera de línea debido al despliegue de la geomembrana de alcohol vinílico etileno (EVOH) aprobada de 60 mils o a la reubicación interina del parque de tanques o bien están en el proceso de ser reparadas (Consulte la Lista de Monitoreos del Adjunto B).

¹ Los laboratorios informaron datos de otros pozos de LFG fuera de los seleccionados para que la LEA tome muestras; los datos adicionales están relacionados con requerimientos de informes separados del Distrito de Gestión de la Calidad del Aire de la Costa Sur (AQMD de la Costa Sur) y por lo tanto pueden desestimarse para los propósitos de este informe.

² Cada gráfico indica un punto de datos de temperatura único debido a cambios en el software.

Se debe tener en cuenta que las bombas que necesitan reparación están a la espera de nuevas partes metalúrgicas que vienen de Europa, para completar la reparación.

Como se indicó previamente, SCS continuará tomando las temperaturas pozo abajo todos los años e informará los resultados a medida que vaya obteniendo datos de cada lugar. (Consulte el **Adjunto B**). Al junio de 2025, SCS ha completado el monitoreo anual de temperaturas pozo abajo de 2025 en todos los lugares solicitados.

4. Tomar muestras de los 40 pozos seleccionados para analizar VOCs utilizando el método TO-15. Consulte en la Tabla 1, la columna rotulada “VOC (TO-15)”.

Los resultados de los pozos monitoreados se proporcionan en el **Adjunto A**.³

5. Continuar tomando muestras y monitoreando los 6 pozos horizontales indicados en el Adjunto 1 donde los números de los pozos están resaltados en amarillo. En este momento podrán liberarse 42 pozos horizontales de las tomas de muestras continuas, pero estos pozos podrán ser incluidos más adelante, dependiendo de las futuras presentaciones de datos. Consulte en la Tabla 1 los números de pozo resaltados en azul.

Como se indicó en la carta del 3 de septiembre de 2024 y se informó en los informes mensuales previos, dos (2) de los seis (6) pozos horizontales (H-1774S y H-1560S) fueron abandonados cuando se instalaron los nuevos pozos de extracción vertical y por lo tanto los datos de esos pozos no están incluidos. Los datos de los otros cuatro (4) pozos horizontales están en el **Adjunto A**.

6. Agregar 20 pozos verticales a los protocolos de toma de muestras mensuales de temperatura en el cabezal y de LFG. Consulte en la Tabla 1 los números de pozo resaltados en verde.

Como lo transmitió la LEA durante nuestra reunión del 12 de septiembre de 2024 y se volvió a indicar en nuestro informe mensual, comprendemos que la LEA está requiriendo datos analíticos de laboratorio para gases fijos, CO y H₂, como también datos de campo. Los resultados del laboratorio están en el **Adjunto A**. Los datos de campo con las temperaturas del gas en el cabezal del pozo se muestran en la Tabla 2 en el **Adjunto A**.

Comprendemos de la correspondencia de la LEA del 27 de noviembre de 2024 que se requerirán datos analíticos del laboratorio para los gases fijos especificados.

Se debe tener en cuenta que nuevamente no se volvieron a tomar muestras en los siguientes pozos en julio de 2025 por los siguientes motivos indicados en los informes mensuales previos:

CV-1420 – Abandonado durante la Expansión del GCCS en 2024 debido a la reducción de los flujos de gas.

CV-2202 – Abandonado durante la Expansión del GCCS en 2024 debido a la reducción de los flujos de gas.

CV-2332 – Este pozo no existe. Este pozo fue propuesto para instalación en otoño de 2023, pero se instalaron otros pozos en la zona en lugar del CV-2332 cuando la cantidad de pozos aumentó según la Orden de Depuración Estipulada (la Orden Estipulada) del Sur avanzando sin esfuerzo AQMD de la Costa Sur.

³ El Pozo CV-24142 aparece dos veces en la Tabla 1 de la carta de la LEA del 30 de julio de 2024 - uno requiere tomas de muestras de VOC y el otro no. Chiquita tomó muestras de este pozo para analizar los VOCs.

7. Trazar en el mapa del sitio denominado "Mapa de GCCS Existentes - Pozos de Extracción Vertical de LFG" con fecha 06/06/2024 las ubicaciones de los siguientes 19 pozos: CV-24002, CV-24003, CV-24007, CV-24017, CV-24053, CV-24055, CV-24065, CV-24071, CV-24075, CV-24077, CV-24079, CV-24082, CV-24083, CV-24088, CV-24095, CV-24096, CV-24097, CV-24098 y H-1403W. Para el pozo H-1403W, proporcionar la ubicación horizontal de las tuberías y un estimativo sobre dónde es más probable que ocurran temperaturas elevadas (195°F). Consultar en la Tabla 1 los números de pozo resaltados en rojo y H-1403W (resaltado en amarillo).

Las ubicaciones de los pozos arriba identificados se muestran en el Mapa en el **Adjunto C**.⁴

8. Incluir en el informe mensual un mapa del asentamiento/calor como se muestra a continuación, comenzando con los datos del mapa de calor más antiguo disponible para cada mes hasta el presente. Si es posible, los mapas topográficos deberán mostrar intervalos de contornos de 2 pies.

La LEA le indicó a Chiquita el 2 de junio de 2025 que presente mapas isopáquicos mensualmente para cumplir con esta solicitud. Para facilidad de referencia, estamos presentando a la LEA como **Adjunto F** una copia del mapa isopáquico mensual más reciente presentado el 12 de agosto de 2025.

9. Proporcionar los resultados de las tomas de muestras en un informe independiente apropiado con el análisis, tablas, AQ/QC y métodos, firmado por un profesional registrado, etc., como se describe en los Objetivos 1A-2 y 1A-3 de la Orden de Cumplimiento.

CCL ha proporcionado la información arriba solicitada y los datos crudos en el **Adjunto A**, como también una figura con la zona reactiva indicada en base a datos, que incorpora datos de asentamientos Consulte el Adjunto A (consulte el **Adjunto F**). Se proporcionan los gráficos de las temperaturas de los pozos con bombas Lorentz (5 lugares).

Se debe tener en cuenta que además de los pozos indicados en respuesta a la solicitud con fecha 30 de julio de 2024 en la Tabla 1 que no pudieron ser testeados, tampoco pudieron testearse los siguientes pozos que solo requerían datos analíticos, como se informó previamente, porque fueron abandonados durante la expansión del GCCS de 2024 debido a la reducción de flujos de gas, conforme a los requerimientos del NSPS: CV-100, CV-1532, H-1560S, H-1774S, TC-2385A, TC-2385S, CV-2202 y CV-1420. Finalmente, Como también se informó previamente, nunca se instaló el CV-2332.

Procedimientos para la Toma de Muestras

Se tomaron muestras de gas utilizando bolsas Tedlar/Mylar, como se describe en la carta del Chiquita del 3 de septiembre de 2024 y en los informes mensuales que se entregaron a laboratorios certificados para su análisis. Todos los datos de gases permanentes (CH₄, CO₂, O₂, N₂, CO y H₂) fueron analizados dentro de las 24 horas solicitadas desde la toma de las muestras. SCS continúa creyendo que el uso del tiempo de retención de 72 horas aprobado por EPA para estas muestras sería apropiado y correcto. No obstante, en respuesta a la correspondencia de la LEA del 17 de marzo de 2025, SCS continuará solicitando tiempos de retención de 24 horas

⁴ La LEA reconoció en su correspondencia del 20 de noviembre de 2024 que no están ocurriendo temperaturas altas en el pozo H-1403W. Por lo tanto no trazamos la temperatura máxima en el pozo H-1403W.

para todos los gases fijos, que incluyen CO, H₂ y VOCs, tomados utilizando bolsas Mylar o Tedlar. No obstante, si se requieren más muestras o si los laboratorios tienen un cambio en la carga de trabajo, este tiempo de retención podrá cambiar, caso en el que se le informará a la LEA como corresponda. Durante julio de 2025, se testearon los VOCs de todos los pozos (método TO-15 de la EPA) y los gases permanentes (métodos 1946 y Alt-144 de la EPA) dentro de las 24 horas, proporcionándole al laboratorio muestras en bolsas duplicadas como se requiere para análisis de VOC.

Se tomaron otros datos de los gases y las presiones utilizando un Medidor de Gas Envision Irwin o un dispositivo de monitoreo de Gases Landtec GEM 5000. Estos instrumentos miden las concentraciones de gas combustible en el aire, directamente en una de dos escalas: la primera, como un porcentaje por volumen del límite explosivo inferior (LEL) de gas metano en el aire (0 a 5 por ciento) y el otro como un porcentaje por volumen (0 a 100 por ciento) en el gas tomado como muestra. El límite de detección de estos instrumentos es de aproximadamente 0.10 por ciento por volumen.

Los procedimientos para testear el monitoreo de gases fueron los siguientes:

- Conectar la tubería de toma de muestras, abrir la válvula de prueba, observar la presión y registrar los datos.
- Encender la bomba de las muestras, purgar un mínimo de un volumen de la sonda y observar y registrar las concentraciones de metano, oxígeno y dióxido de carbono en el gas cuando se hayan estabilizado las lecturas.
- Cerrar la válvula de prueba, desconectar los instrumentos de toma de muestras y resguardar la ubicación de la muestra.

Conclusiones del Objetivo 1A-3

En julio de 2025 se realizó el duodécimo monitoreo en cumplimiento con el Objetivo 1A-3 de la Orden de Cumplimiento. Los datos tomados en julio de 2025 y evaluados para este informe son consistentes con los datos tomados los meses anteriores desde agosto de 2024 hasta junio de 2025, como también los datos tomados y evaluados por el Comité de la Reacción establecidos bajo la supervisión del Distrito de Gestión de la Calidad del Aire de la Costa Sur (SCAQMD) y conforme a la Orden Estipulada para evaluar la zona reactiva, que incluyen los datos de julio de 2025 más recientemente evaluados por el Comité de la Reacción el 8 de agosto de 2025, como lo requiere la Condición 9(b) de la Orden Estipulada. Consulte el **Adjunto E**.

Por los motivos descritos en el informe adjunto del Comité de la Reacción del 8 de agosto de 2025, la alineación del alcance estimado de las condiciones del vertedero de temperaturas elevadas (ETLF) exhibidas en el Vertedero (a las que se hace referencia como límites de la "Zona Reactiva") e identificadas en ese informe continúa igual a las identificadas en el informe del Comité de la Reacción de julio de 2025. El Comité de la Reacción determinó que no se justificaba realizar ningún ajuste y que no se habían expandido las condiciones de ETLF. No hubo evidencia consistente de condiciones de la reacción ni gas de la reacción presente fuera del límite de la zona reactiva actualmente delineada.

Como los niveles de líquidos por la instalación de otras Bombas Eléctricas y Neumáticas Lorentz continúan cambiando, continuamos viendo los cambios previstos en porcentajes de Gases Permanentes, Monóxido de Carbono e Hidrógeno y los cambios en las temperaturas ya que puede pasarse extraerse por los pozos de extracción a medida que se van reduciendo los niveles de líquido. Esto se continúa demostrando en los gráficos de los pozos a varias escalas en el **Adjunto D**, que incluyen gráficos de los gases permanentes, temperatura y otras tendencias en un período de seis (6) meses. Se debe tener en cuenta que los gráficos fueron creados utilizando resultados de equipos de monitoreo de biogás estándar y los resultados no contienen datos de laboratorio. SCS también incluyó gráficos de Hidrógeno y Monóxido de Carbono separados utilizando los resultados del laboratorio, para su uso y revisión de cada pozo.

Además, la instalación de tuberías de mayor diámetro ha mejorado la recolección de otros gases de todo el Vertedero. Desde marzo de 2025, los índices de flujo de biogás que queman los dispositivos de depuración aumentaron de 13,500 cfm a 15,550 cfm. Durante julio de 2025, la extracción de gas general del Vertedero fue de aproximadamente 675,394,000 pies cúbicos. Se espera que este índice de extracción de biogás y los futuros aumentos previstos a este índice de extracción a medida que continúan expandiéndose los sistemas de recolección, mejorarán la composición del gas de los pozos en la zona reactiva a medida que más vacío y el movimiento de gas resultante vaya permitiendo que se extraiga más gas de la reacción y del vertedero normal.

Chiquita continuará evaluando los datos en futuros informes mensuales, a medida que se vayan tomando más datos.

Puntos de Cumplimiento con el Objetivo 5

Este informe incluye en el **Adjunto D** mapas individuales superpuestos con los siguientes datos para julio de 2025, en un formato fácil de comprender, conforme al Objetivo 5 de la Orden de Cumplimiento.

- Zona reactiva definida;
- Expansión de la zona reactiva, si hubiera;
- Datos semanales de TMP; y
- Datos de LFG que incluyen, de forma enunciativa más no limitativa, datos de CH₄, CO₂, O₂, Temperatura CO y de H₂.

El Objetivo 5 además requiere "asentamiento con mapas de calor", pero como se analizó al principio de este informe y conforme a la correspondencia de la LEA con fecha 27 de noviembre y 3 de diciembre de 2024, este requerimiento se cumple con la presentación de Chiquita de su mapa isopáquico de julio de 2025, presentado a la LEA el 12 de agosto de 2025. Para practicidad de la LEA, este mapa se incluye aquí nuevamente como **Adjunto F**.

LABORATORY TEST RESULTS

Project Reference: Chiquita Canyon Landfill
Project Number: 07224200.24 Task 1
Lab Number: S070107-01/10

Enclosed are the results for sample(s) received 7/1/25 by Air Technology. Samples were received intact. Analyses were performed according to specifications on the chain of custody provided with the sample(s).

Report Narrative:

- Modifications to EPA TO-15 – Vinyl acetate, benzyl chloride, and 1,2,4-trichlorobenzene required quadratic regression calibration.
- Bromoform exhibited low recovery in the initial calibration verification indicating possible low bias. Results were flagged with the Q qualifier.
- Unless otherwise noted in the report, sample analyses were performed within method performance criteria and meet all requirements of the TNI Standards.
- The enclosed results relate only to the sample(s).

Preliminary results were e-mailed to Cornelius Fong, Jenny Kim, Art Jones and Ali Ferrara on 7/14/25.

ATL appreciates the opportunity to provide testing services to your company. If you have any questions regarding these results, please call me at (626) 964-4032.

Sincerely,

Mark Johnson
Operations Manager

LABORATORY TEST RESULTS

Project Reference: Chiquita Canyon Landfill
Project Number: 07224200.24 Task 1
Lab Number: S070204-01/10

Enclosed are the results for sample(s) received 7/2/25 by Air Technology. Samples were received intact. Analyses were performed according to specifications on the chain of custody provided with the sample(s).

Report Narrative:

- Modifications to EPA TO-15 – Vinyl acetate, benzyl chloride, and 1,2,4-trichlorobenzene required quadratic regression calibration.
- Bromoform exhibited low recovery in the initial calibration verification indicating possible low bias. Results were flagged with the Q qualifier.
- Benzyl chloride exhibited low recovery in the continuing calibration verification indicating possible low bias. Results were flagged with the Q qualifier.
- Unless otherwise noted in the report, sample analyses were performed within method performance criteria and meet all requirements of the TNI Standards.
- The enclosed results relate only to the sample(s).

Preliminary results were e-mailed to Cornelius Fong, Jenny Kim, Art Jones and Ali Ferrara on 7/14/25.

ATL appreciates the opportunity to provide testing services to your company. If you have any questions regarding these results, please call me at (626) 964-4032.

Sincerely,

A handwritten signature in blue ink that reads "Mark Johnson".

LABORATORY TEST RESULTS

Project Reference: Chiquita Canyon Landfill
Project Number: 07224200.24 Task 1
Lab Number: S070703-01/10

Enclosed are the results for sample(s) received 7/7/25 by Air Technology. Samples were received intact. Analyses were performed according to specifications on the chain of custody provided with the sample(s).

Report Narrative:

- Modifications to EPA TO-15 – Vinyl acetate, benzyl chloride, and 1,2,4-trichlorobenzene required quadratic regression calibration.
- Bromoform exhibited low recovery in the initial calibration verification indicating possible low bias. Ethyl acetate exhibited high recovery indicating a possible high bias. Results were flagged with the Q qualifier.
- Benzyl chloride exhibited low recovery in the continuing calibration verification indicating possible low bias. Results were flagged with the Q qualifier.
- Unless otherwise noted in the report, sample analyses were performed within method performance criteria and meet all requirements of the TNI Standards.
- The enclosed results relate only to the sample(s).

Preliminary results were e-mailed to Cornelius Fong, Jenny Kim, Art Jones and Ali Ferrara on 7/18/25.

ATL appreciates the opportunity to provide testing services to your company. If you have any questions regarding these results, please call me at (626) 964-4032.

Sincerely,

A handwritten signature in blue ink that reads "Mark Johnson".

LABORATORY TEST RESULTS

Project Reference: Chiquita Canyon Landfill
Project Number: 07224200.24 Task 1
Lab Number: S070802-01/10

Enclosed are the results for sample(s) received 7/8/25 by Air Technology. Samples were received intact. Analyses were performed according to specifications on the chain of custody provided with the sample(s).

Report Narrative:

- Modifications to EPA TO-15 – Vinyl acetate, benzyl chloride, and 1,2,4-trichlorobenzene required quadratic regression calibration.
- Bromoform exhibited low recovery in the initial calibration verification (ICV) indicating possible low bias. Results were flagged with the Q qualifier.
- Ethyl acetate exhibited high recovery in the ICV indicating possible high bias. Results were flagged with the Q qualifier.
- Benzyl chloride low recovery in the continuing calibration verification indicating low bias. Results were flagged with the Q qualifier.
- Unless otherwise noted in the report, sample analyses were performed within method performance criteria and meet all requirements of the TNI Standards.
- The enclosed results relate only to the sample(s).

Preliminary results were e-mailed to Cornelius Fong, Jenny Kim, Art Jones and Ali Ferrara on 7/18/25.

ATL appreciates the opportunity to provide testing services to your company. If you have any questions regarding these results, please call me at (626) 964-4032.

Sincerely,

A handwritten signature in blue ink that reads "Mark Johnson".

Project Number: 07224200.24 Task 1
Lab Number: S070901-10/10

Enclosed are the results for sample(s) received 7/9/25 by Air Technology. Samples were received intact. Analyses were performed according to specifications on the chain of custody provided with the sample(s).

Report Narrative:

- Modifications to EPA TO-15 - Vinyl acetate, benzyl chloride, and 1,2,4-trichlorobenzene required quadratic regression calibration.
- Bromoform exhibited low recovery in the initial calibration verification indicating possible low bias. Results were flagged with the Q qualifier.
- Benzyl chloride exhibited low recovery in the continuing calibration verification indicating possible low bias. Results were flagged with the Q qualifier.
- Unless otherwise noted in the report, sample analyses were performed within method performance criteria and meet all requirements of the TNI Standards.
- The enclosed results relate only to the sample(s).

Preliminary results were e-mailed to Cornelius Fong, Jenny Kim, Art Jones and Ali Ferrara on 7/18/25.

ATL appreciates the opportunity to provide testing services to your company. If you have any questions regarding these results, please call me at (626) 964-4032.

Sincerely,

A handwritten signature in blue ink, appearing to read "Mark Johnson".

Mark Johnson

LABORATORY TEST RESULTS

Project Reference: Chiquita Canyon Landfill
Project Number: 07224200.24 Task 1
Lab Number: S071008-01/10

Enclosed are the results for sample(s) received 7/10/25 by Air Technology. Samples were received intact. Analyses were performed according to specifications on the chain of custody provided with the sample(s).

Report Narrative:

- Modifications to EPA TO-15 – Vinyl acetate, benzyl chloride, and 1,2,4-trichlorobenzene required quadratic regression calibration.
- Bromoform exhibited low recovery in the initial calibration verification indicating possible low bias. Ethyl acetate exhibited high recovery indicating a possible high bias. Results were flagged with the Q qualifier.
- Benzyl chloride exhibited low recovery in the continuing calibration verification indicating possible low bias. Results were flagged with the Q qualifier.
- Unless otherwise noted in the report, sample analyses were performed within method performance criteria and meet all requirements of the TNI Standards.
- The enclosed results relate only to the sample(s).

Preliminary results were e-mailed to Cornelius Fong, Jenny Kim, Art Jones and Ali Ferrara on 7/21/25.

ATL appreciates the opportunity to provide testing services to your company. If you have any questions regarding these results, please call me at (626) 964-4032.

Sincerely,

A handwritten signature in blue ink that reads "Mark Johnson".

Mark Johnson

LABORATORY TEST RESULTS

Project Reference: Chiquita Canyon Landfill
Project Number: 07224200.24 Task 1
Lab Number: S071504-01/10

Enclosed are the results for sample(s) received 7/15/25 by Air Technology. Samples were received intact. Analyses were performed according to specifications on the chain of custody provided with the sample(s).

Report Narrative:

- Modifications to EPA TO-15 – Vinyl acetate, benzyl chloride, and 1,2,4-trichlorobenzene required quadratic regression calibration.
- Bromoform exhibited low recovery in the initial calibration verification indicating possible low bias. Results were flagged with the Q qualifier.
- Ethyl acetate exhibited high recovery in the initial calibration verification indicating possible high bias. Results were flagged with the Q qualifier.
- Unless otherwise noted in the report, sample analyses were performed within method performance criteria and meet all requirements of the TNI Standards.
- The enclosed results relate only to the sample(s).

Preliminary results were e-mailed to Cornelius Fong, Jenny Kim, Art Jones and Ali Ferrara on 7/23/25.

ATL appreciates the opportunity to provide testing services to your company. If you have any questions regarding these results, please call me at (626) 964-4032.

Sincerely,

A handwritten signature in blue ink, appearing to read "Mark Johnson".

The graph displays the concentration of Carbon Monoxide / CV-24017 over a period from July 1, 2024, to June 16, 2025. The y-axis represents the concentration level, ranging from 0 to 6080. The x-axis shows dates at weekly intervals. The data is presented as a series of connected points, showing fluctuations in concentration over time. Notable peaks occur around 08-20-24 (approx. 1824) and 06-16-25 (approx. 6080). The concentration generally shows an upward trend, with several smaller peaks and troughs in between.

Thirty Day Maximum Vertical Temperature Map from Temperature Probes at Chiquita Landfill

Solid Waste Borehole Maximum Temperature Profiles Over 6 Weeks for 5/22/2025 to 7/2/2025

From June 26, 2025, through July 2, 2025, there was one recorded temperature decrease and one recorded temperature increase that triggered the notification limits set forth in the LEA's October 4, 2024 letter. Note that the one recorded temperature increase reported last week was an anomalous and likely erroneous reading as described in last week's submittal and below.

Additionally, as of April 4, 2025, twelve new TMPs (TMP-21, TMP-24, TMP-25, TMP-26, TMP-27, TMP-28, TMP-29, TMP-30, TMP-31, TMP-32, TMP-34, and TMP-35) have been installed and are online. None of these twelve new TMPs indicate reaction temperatures occurring outside of the currently delineated data-driven reaction area boundary, and the four TMPs that were able to be drilled to within 25 feet of the liner (TMP-24, TMP-27, TMP-31, and TMP-32) show significantly cooler temperatures at the deepest thermocouple, as expected due to the cooling from the underlying earth.

Chiquita provides the following updates:

- TP-08
 - The 45-foot thermocouple remained consistent with previous recorded temperatures.
- TP-11
 - The 45-foot thermocouple showed a decrease in maximum temperature of 10 ° F from 161 ° F to 151 ° F from June 26th to July 2nd.
- TP-16
 - The 15-foot thermocouple showed an increase in maximum temperature of 11 ° F from 128 ° F to 139 ° F from June 26th to July 2nd.
 - The 45 foot thermocouple remained consistent with previous recorded temperatures. As noted in last week's submittal, the 45-foot thermocouple showed an anomalous reading on June 22nd of 222 ° F for a single one-hour reading; however, subsequent readings were consistent with previous recorded temperatures and no other thermocouples at TP-16 showed any such changes in temperatures, indicating that this recorded temperature increase was most likely erroneous.

Solid Waste Borehole Maximum Temperature Profiles Over 6 Weeks for 5/29/2025 to 7/9/2025

From July 3, 2025, through July 9, 2025, there was one recorded temperature increase that triggered the notification limits set forth in the LEA's October 4, 2024 letter.

Additionally, as of April 4, 2025, twelve new TMPs (TMP-21, TMP-24, TMP-25, TMP-26, TMP-27, TMP-28, TMP-29, TMP-30, TMP-31, TMP-32, TMP-34, and TMP-35) have been installed and are online. None of these twelve new TMPs indicate reaction temperatures occurring outside of the currently delineated data-driven reaction area boundary, and the four TMPs that were able to be drilled to within 25 feet of the liner (TMP-24, TMP-27, TMP-31, and TMP-32) show significantly cooler temperatures at the deepest thermocouple, as expected due to the cooling from the underlying earth.

Chiquita provides the following updates:

- TP-11
 - The 45-foot thermocouple showed an increase in maximum temperature of 10 °F from 148 °F to 158 °F from July 5th to July 9th.
- TP-16
 - The 15-foot thermocouple remained consistent with previous recorded temperatures.
 - The 45-foot thermocouple remained consistent with previous recorded temperatures. As noted in previous submittals, the 45-foot thermocouple showed an anomalous reading on June 22nd of 222 °F for a single one-hour reading; however, subsequent readings were consistent with previous recorded temperatures and no other thermocouples at TP-16 showed any such changes in temperatures, indicating that this recorded temperature increase was most likely erroneous.

Solid Waste Borehole Maximum Temperature Profiles Over 6 Weeks for 6/12/2025 to 7/23/2025

From July 17, 2025, through July 23, 2025, there were two recorded temperature decreases and three recorded temperature increases that triggered the notification limits set forth in the LEA's October 4, 2024 letter.

Additionally, as of April 4, 2025, twelve new TMPs (TMP-21, TMP-24, TMP-25, TMP-26, TMP-27, TMP-28, TMP-29, TMP-30, TMP-31, TMP-32, TMP-34, and TMP-35) have been installed and are online. None of these twelve new TMPs indicate reaction temperatures occurring outside of the currently delineated data-driven reaction area boundary, and the four TMPs that were able to be drilled to within 25 feet of the liner (TMP-24, TMP-27, TMP-31, and TMP-32) show significantly cooler temperatures at the deepest thermocouple, as expected due to the cooling from the underlying earth.

Chiquita provides the following updates:

- TP-03
 - The 30-foot thermocouple showed a decrease in maximum temperature of 10 ° F from 221 ° F to 211 ° F from July 19th to July 21st.
- TP-15
 - The 30-foot thermocouple showed a decrease in maximum temperature of 13 ° F from 174 ° F to 161 ° F from July 12th to July 19th, and then an increase in maximum temperature of 11 ° F from 161 ° F to 172 ° F from July 19th to July 23rd.
 - The 45-foot thermocouple showed an increase in maximum temperature of 12 ° F from 174 ° F to 186 ° F from July 16th to July 23rd.
 - The 75-foot thermocouple showed an increase in maximum temperature of 10 ° F from 178 ° F to 188 ° F from July 16th to July 23rd.
- TP-16
 - The 45-foot thermocouple remained consistent with previous recorded temperatures. As noted in previous submittals, the 45-foot thermocouple showed an anomalous reading on June 22nd of 222 ° F for a single one-hour reading; however, subsequent readings were consistent with previous recorded temperatures and no other thermocouples at TP-16 showed any such changes in temperatures, indicating that this recorded temperature increase was most likely erroneous.

Solid Waste Borehole Maximum Temperature Profiles Over 6 Weeks for 6/26/2025 to 8/6/2025

From July 31, 2025, through August 6, 2025, there were two recorded temperature decreases and three recorded temperature increases that triggered the notification limits set forth in the LEA's October 4, 2024 letter.

Additionally, as of April 4, 2025, twelve new TMPs (TMP-21, TMP-24, TMP-25, TMP-26, TMP-27, TMP-28, TMP-29, TMP-30, TMP-31, TMP-32, TMP-34, and TMP-35) have been installed and are online. None of these twelve new TMPs indicate reaction temperatures occurring outside of the currently delineated data-driven reaction area boundary, and the four TMPs that were able to be drilled to within 25 feet of the liner (TMP-24, TMP-27, TMP-31, and TMP-32) show significantly cooler temperatures at the deepest thermocouple, as expected due to the cooling from the underlying earth.

Chiquita provides the following updates:

- TP-07
 - The 60-foot thermocouple showed an increase in maximum temperature of 23 ° F from 131 ° F to 154 ° F from July 30th to August 1st, and then a decrease in maximum temperature of 23 ° F from 154 ° F to 131 ° F from August 1st to August 2nd, and then an increase in maximum temperature of 14 ° F from 131 ° F to 145 ° F from August 2nd to August 4th, and then a decrease in maximum temperature of 14 ° F from 145 ° F to 131 ° F from August 4th to August 5th.
- TP-11
 - The 45-foot thermocouple remained consistent with previous recorded temperatures
- TP-13
 - The 30-foot thermocouple showed an increase in maximum temperature of 20 ° F from 135 ° F to 155 ° F from July 30th to August 6th.
- TP-15
 - The 30-foot thermocouple remained consistent with previous recorded temperatures.

Diamond Bar, California 91765

Subject: Monthly Reaction Committee Determination on Reaction Area Boundary
Chiquita Canyon Landfill – Castaic, California

Dear Mr. Chen:

In accordance with Condition Nos. 9a and 9b of the Modified Stipulated Order for Abatement (SOFA) pertaining to the Chiquita Canyon Landfill (Landfill or Facility) (Case No. 6177-4), the Reaction Committee has reviewed newly acquired applicable data recorded during the month of July 2025, considered revisions of the estimated extent of elevated temperature landfill (ETLF) conditions exhibited at the subject Facility (referred to as the “Reaction Area” limits), and has prepared this determination on potentially revising the Reaction Area map.

Attachment A presents the Drawing, titled “Reaction Area Map”, prepared by SCS Engineers (SCS) and dated August 6, 2025. The Drawing depicts the Reaction Area boundary as prescribed in Condition No. 9a, which corresponds to the limits of Cells 1/2A, 2B/3, 4, and Module 2B/3/4 P2, as a solid black line. The Drawing also depicts the estimated extent of ETLF conditions being experienced at the site based on the Reaction Committee’s review of scientific data as a dashed magenta line. The rationale that serves as the basis for considering adjustments and modifications to the Reaction Area boundary (or the determination to maintain the decreed boundary), include the following:

- Landfill Gas (LFG) wellhead temperatures in excess of approximately 160 degrees Fahrenheit.
- Poor gas quality (defined as methane levels of less than 30 percent) in conjunction with methane-to-carbon dioxide (CH₄:CO₂) ratios less than 1.0.
- The concentration of hydrogen (H₂) in the LFG measured greater than 2 percent by volume.
- The concentration of carbon monoxide (CO) in the LFG measured greater than 2,000 ppm.
- Accelerated settlement of the landfill surface, defined as approximately 18 inches or greater within a 60-day period, and cracks in landfill cover. This corresponds to a strain value (i.e., settlement rate) rate of 3 percent per year for areas with a 300-foot waste column depth, which we believe is a reasonable average depth in the subject area of interest.
- First-hand observations of Landfill and/or SCS engineering, construction, and operations and maintenance (O&M) field personnel who are on-site related to: 1) atypical excess leachate quantities (presence and quantity of liquids); 2) instances of pressurized liquids emitting from the landfill surface, from boreholes during drilling, and from LFG wells; and, 3) the

characteristics of the odors originating from the select areas of the waste footprint (often described as “chemical-like” and distinctly different from typical LFG or landfill working face odors).

- Observations of subsurface waste conditions and characteristics as noted on borehole drilling logs for recently installed new wells and/or probes.
- Subsurface temperatures recorded at the in-situ waste temperature probes during July 2025.
- Temperature of gas or liquids measured at depth within the LFG well riser pipe (using an automated transmitter or manual field instrumentation).
- Subsurface temperature and pressures associated with drilling activities for new LFG extraction wells during July 2025.

CONSIDERATIONS FOR POTENTIAL ADJUSTMENTS TO THE ESTIMATED EXTENT OF ETLF CONDITIONS (DASHED MAGENTA LINE)

In making its monthly determinations, the Reaction Committee evaluates the above set of data parameters, in conjunction with one another, to identify meaningful trends indicating ETLF conditions, as opposed to fluctuations exhibited in isolated datapoints.

Each month, the Reaction Committee scrutinizes particular areas of the Landfill that have previously exhibited abnormal or fluctuating data, when applicable. As discussed below, despite minor variances in discrete areas of the landfill, the Reaction Committee has not discerned any meaningful trends with respect to the July 2025 data that would indicate the reaction has expanded into these areas.

Near CV-24009 and CV-24011

Well CV-24009 is positioned within 60 feet or so of the delineated boundary line and Well CV-24011 is positioned within 25 feet or so of the delineated boundary. Both wells recorded LFG wellhead temperatures in the range of 160 to 162 degrees F during June and July, however the average LFG wellhead temperatures measured during April through July for these two wells were 155 and 154 F, respectively.

The LFG quality is marginal at CV-24009, which has exhibited an average methane (CH_4) concentration of 23 percent during January through July, and the methane-to-carbon dioxide ($\text{CH}_4:\text{CO}_2$) ratio in July was 0.23. The carbon monoxide (CO) concentration at CV-24009 measured during June and July was approximately 435 ppm. The hydrogen (H_2) concentration measured in July was 9.0 percent.

The LFG quality at CV-24011 is rather poor, with an average methane concentration of only 14 percent during January through July, and the methane-to-carbon dioxide ($\text{CH}_4:\text{CO}_2$) ratio in July was 0.35. The carbon monoxide (CO) concentration at CV-24011 measured during June and July was approximately 5,700 ppm. The H_2 concentration measured in July was 13.7 percent.

Adjacent well CV-24007 exhibits hydrogen (H_2) concentrations in the 2 to 4 percent range, but the average LFG wellhead temperatures measured during May through July are only 132 degrees F. Adjacent well CV-24008 exhibited a wellhead temperature of 161 degrees F during July, but the average LFG wellhead temperature measured during May through July was only 114 degrees F.

The Reaction Committee has identified gas movement from within the reaction area via existing horizontal collectors as the potential cause of the short-term increase in heat and longer-term trend of marginal to poor quality gas at these wells. Specifically, well CV-24009 is positioned immediately adjacent to H-1769 (at an elevation of 1335 feet) and CV-24011 is positioned immediately adjacent to H-59 (at an elevation of 1280 feet), both of which extend hundreds of feet into the reaction area, so it is possible that the source of the heat and reaction gas at these vertical wells is offset some distance away and is being conveyed toward the wells by the horizontal collectors' piping and trench. In addition, both CV-24009 and CV-24011 are equipped with a dedicated dewatering pump, so the recent increase in temperatures and the presence of increased reaction gas (as opposed to typical landfill gas) may be attributable to the lowering of perched leachate levels in this vicinity, which is enabling movement of heat and gas through the void spaces.

Near CV-24126

Well CV-24126 is positioned within 100 feet or so of the delineated boundary. Well CV-24126 recorded LFG wellhead temperatures in the range of 162 to 168 degrees F during June and July, however the average LFG wellhead temperatures measured during April through July for this well was only 145 degrees F.

The LFG quality at CV-24126 is poor, with an average CH_4 concentration of only 6 percent during January through July, and the $CH_4:CO_2$ ratio in July was 0.3. The average CO concentration during June and July was 2,660 ppm. The H_2 concentration measured in July was 5.0 percent.

The LFG quality at adjacent well CV-2333 is also poor, with an average CH_4 concentration of only 3 percent during May through July, and the average CO concentration was 3,000 ppm during this period. Adjacent wells CV-24127 and CV-24134 exhibited average CH_4 concentrations of 24 and 19 percent, respectively during May through July. Adjacent wells CV-2333, CV-24127, and CV-24134 exhibited H_2 concentrations during July of 17, 6, and 14 percent, respectively. However, the average LFG wellhead temperatures measured at these three wells during May through July are only 130, 112, and 148 degrees F, respectively. The maximum in-situ waste temperature (measured at the 150-foot depth interval) in TP-19, which is co-located with well CV-24134, was 162 degrees F.

The Reaction Committee has identified gas movement from within the reaction area via existing horizontal collectors as the potential cause of the short-term increase in heat at CV-24126 and longer-term trend of marginal to poor quality gas at the adjacent three wells. Specifically, well CV-24126 is positioned in close proximity to H-56 (at an elevation of 1240 feet), which extends hundreds of feet into the reaction area, so it is possible that the source of the heat and reaction gas at this vertical well is offset some distance away and is being conveyed toward the wells by the horizontal collectors' piping and trench. In addition, CV-2333, CV-24126, and CV-24127 are equipped with a dedicated dewatering pump, so the recent increase in temperatures and the presence of increased reaction gas (as opposed to typical landfill gas) may be attributable to the lowering of perched leachate levels in this vicinity, which is enabling movement of heat and gas through the void spaces.

Near CV-2541 and CV-24068

Well CV-2541 is a new well that was installed on June 19, 2025, that is positioned within 25 feet or so of the delineated boundary line. It is positioned immediately adjacent to horizontal collector H-54 (at an elevation of 1225 feet) and H-1564 (at an elevation of 1245 feet), both of which extend hundreds of feet into the reaction area. Well CV-2541 initially recorded a temperature of 194 degrees F, but the average temperature since installation is 159 degrees F. The LFG quality at CV-2541 is particularly poor, with an average CH₄ concentration of only 5 percent since installation, and the CH₄:CO₂ ratio in July was 0.1. The average CO concentration during June and July was 2,167 ppm.

The average LFG wellhead temperature measured in the adjacent well CV-24068 during May through July was 148 degrees F. The LFG quality at CV-24068 is marginal, with an average CH₄ concentration of 16 percent during May through July. The average CO concentration during May through July was 1,998 ppm. The H₂ concentration measured in well CV-24068 during July was 6 percent.

The average LFG wellhead temperatures measured in the adjacent wells CV-24066 and CV-24079 during May through July were 112 and 155 degrees F, respectively. The H₂ concentrations measured in wells CV-24066 and CV-24079 during July were 2 and 4 percent, respectively.

Considering the most recent temperatures are relatively low for ETLF conditions, along with the proximity to horizontal collectors and the fact that CV-2541 has only been monitored on a few instances since installation in mid-June, the Reaction Committee does not believe an adjustment to the boundary of the Reaction Area to include the portions of the waste footprint inclusive of CV-2541 or CV-24068 is warranted at this time.

TEMPERATURE MONITORING PROBE DATA

The Reaction Committee reviewed the temperature measurements recorded during July 2025 by the in-situ temperature monitoring probes. As of July 2025, six of the 32 probes (TP-2, 3, 9, 11, 15, and 21) are located within the current estimated extent of ETLF conditions (dashed magenta line). Of the remaining twenty-six (26) probes positioned outside of the boundary, twelve probes are positioned within relatively close proximity (within 200 feet) of this boundary. It is the Reaction Committee's opinion that the temperatures recorded by the 26 probes outside of the boundary during July 2025 are not indicative of a subsurface reaction and do not substantiate a decision to adjust the boundary of the Reaction Area at this time.

The Reaction Committee continues to closely observe the temperature fluctuations in TP-8 and noted that nearly all depth intervals exhibited a decrease in temperature of approximately 10 degrees F during the past six weeks, which is inconsistent with ETLF conditions. The Reaction Committee continues to closely observe the subtle increases in temperatures in TP-13, to assess whether these constitute trends consistent with ETLF conditions at this location. However, the LFG temperatures recorded at the co-located LFG wellhead (CV-24073) remain less than 160 degrees F.

The Reaction Committee noted significant decreases in the maximum temperatures at the following temperature monitoring probes located within the current estimated extent of ETLF conditions:

- TP-9: The maximum temperature declined from 219 to 209 degrees F during the 4-week period of June 26 through July 24, 2025;
- TP-15: The maximum temperature declined from 198 to 188 degrees F during the 12-week period of May 1 through July 24, 2025;
- TP-21: The maximum temperature declined from 255 to 214 degrees F during the 12-week period of May 1 through July 24, 2025;

The Reaction Committee evaluated the 30-day maximum temperatures recorded in TP-24, TP-26, TP-29, TP-30, and TP-31, which have remained relatively consistent over the previous 12-week period of May 1 through July 24, 2025. The Reaction Committee noted differentiation between the 30-day maximum temperatures in these five probes compared to the 30-day maximum temperatures measured at the three probes within the current estimated extent of ETLF conditions (dashed magenta line), specifically TP-3, TP-9, and TP-21. Based on this differentiation, along with consideration of the other relevant criteria and data parameters, the Reaction Committee does not believe an adjustment to the boundary of the Reaction Area to include the portions of the waste footprint inclusive of TP-24, TP-26, TP-29, TP-30, and TP-31 is warranted at this time.

HYDROGEN CONCENTRATIONS

The Reaction Committee also evaluated the concentration of hydrogen in LFG during July 2025. Recall that certain wells positioned to the south and east of the Reaction Area boundary (where dewatering pumping was reactivated) have periodically demonstrated some increased hydrogen content in the LFG during the Reaction Committee's review of the data in previous months, which similarly was the case for the July data. The Reaction Committee noted in its review of the data that, other than well CV-24-126, these wells did not exhibit elevated temperatures. There was no evidence of the increased heat that is typical with ETLF conditions present at the wells exhibiting atypical hydrogen concentrations (except well CV-24-126). As noted previously, the Reaction Committee suspects this increased hydrogen content may be attributable to substantial dewatering being accomplished throughout the Reaction Area and may be associated with gas movement from within the Reaction Area by existing horizontal collectors in close proximity. Thus, the presence of elevated hydrogen in these isolated locations does not suggest that ETLF conditions are expanding south and east of the delineated boundary. Accordingly, the Reaction Committee does not believe an adjustment to the boundary of the Reaction Area is warranted at this time.

CONCLUSION

As presented on the Drawing included as **Attachment A**, the estimated extent of ETLF conditions (dashed magenta line) is fully contained within the Reaction Area boundary decreed in the SOFA (solid black line). Because the ETLF conditions are fully contained within the Reaction Area boundary and have not expanded into a new cell, the Reaction Committee finds no basis to modify the Reaction Area boundary as prescribed in Condition 9a at this time.

There was no dissenting opinion among the Reaction Committee members regarding this monthly determination. Supporting data is presented on the Drawing included as **Attachment A**. The maximum temperature measurements recorded at the 32 in-situ waste temperature monitoring probes during July are presented in **Attachment B** in graphical format. The LFG wellhead

temperatures recorded at the extraction wells for the entire Landfill footprint are reflected on the isothermal gradient range map presented as **Attachment C**. The CH₄:CO₂ ratios measured at the LFG wellheads in the vicinity of the data-driven Reaction Area boundary are depicted on the range map presented as **Attachment D**. The H₂ concentrations measured at the LFG wellheads in the vicinity of the data-driven Reaction Area boundary are depicted on the range map presented as **Attachment E**. The CO concentrations measured at the LFG wellheads in the vicinity of the data-driven Reaction Area boundary are depicted on the range map presented as **Attachment F**. The landfill surface settlement isopach values measured on a quarterly basis (April 2, 2025 compared to July 2, 2025) in the vicinity of the data-driven Reaction Area boundary are depicted on the range map presented as **Attachment G**. The electronic database and recordkeeping platform enables these measurements to be downloaded into a tabular spreadsheet format, which can be submitted to the South Coast Air Quality Management District under separate cover, if requested.

Solid Waste Borehole Maximum Temperature Profiles Over 6 Weeks for 6/12/2025 to 7/23/2025

From July 17, 2025, through July 23, 2025, there were two recorded temperature decreases and three recorded temperature increases that triggered the notification limits set forth in the LEA's October 4, 2024 letter.

Additionally, as of April 4, 2025, twelve new TMPs (TMP-21, TMP-24, TMP-25, TMP-26, TMP-27, TMP-28, TMP-29, TMP-30, TMP-31, TMP-32, TMP-34, and TMP-35) have been installed and are online. None of these twelve new TMPs indicate reaction temperatures occurring outside of the currently delineated data-driven reaction area boundary, and the four TMPs that were able to be drilled to within 25 feet of the liner (TMP-24, TMP-27, TMP-31, and TMP-32) show significantly cooler temperatures at the deepest thermocouple, as expected due to the cooling from the underlying earth.

Chiquita provides the following updates:

- TP-03
 - The 30-foot thermocouple showed a decrease in maximum temperature of 10 ° F from 221 ° F to 211 ° F from July 19th to July 21st.
- TP-15
 - The 30-foot thermocouple showed a decrease in maximum temperature of 13 ° F from 174 ° F to 161 ° F from July 12th to July 19th, and then an increase in maximum temperature of 11 ° F from 161 ° F to 172 ° F from July 19th to July 23rd.
 - The 45-foot thermocouple showed an increase in maximum temperature of 12 ° F from 174 ° F to 186 ° F from July 16th to July 23rd.
 - The 75-foot thermocouple showed an increase in maximum temperature of 10 ° F from 178 ° F to 188 ° F from July 16th to July 23rd.
- TP-16
 - The 45-foot thermocouple remained consistent with previous recorded temperatures. As noted in previous submittals, the 45-foot thermocouple showed an anomalous reading on June 22nd of 222 ° F for a single one-hour reading; however, subsequent readings were consistent with previous recorded temperatures and no other thermocouples at TP-16 showed any such changes in temperatures, indicating that this recorded temperature increase was most likely erroneous.
