**Re: Investigative Order No. R4-2024-0010-A01
Los Angeles Regional Water Quality Control Board**

Dear Dr. Casas:

This submittal has been prepared for the Los Angeles Regional Water Quality Control Board (“Regional Board”), by Chiquita Canyon, LLC (“Chiquita”) as required by the Investigative Order No. R4-2024-0010-A01 (the “Amended Order”), issued by the Regional Board on February 11, 2026.¹ Pursuant to Item 1(j) of the Amended Order, Chiquita produces the following information regarding a storm event at the Chiquita Canyon Landfill (“the Landfill”) that occurred on April 12, 2026, which resulted in a discharge into the South Sedimentation Basin (“South Basin”) on April 12, 2026. In anticipation of the storm event, stormwater from the upper basins was pumped down to the South Basin on April 11, 2026, which resulted in a discharge into the western inlet of the South Basin.² Additionally, on April 14, 2026, stormwater from the tank farm basins was pumped to the South Basin, which resulted in a discharge into the eastern inlet of the South Basin.

I. Post-Storm Event Assessment and Geosynthetic Cover Analysis

Condition 1(g) of the Order requires the following:

For storms that produce a discharge into the sedimentation basin, a post-storm event assessment and report on the effectiveness of the geosynthetic cover that will be installed over a portion of the area impacted by the reaction to prevent leachate from commingling with stormwater until the elevated Landfill temperature condition has resolved. This report is due 30 days after the first day of the storm event that produces a discharge.

¹ Pursuant to Water Code Section 13320, Chiquita petitioned the State Water Quality Control Board for review of this Amended Order on March 13, 2026.

² Chiquita received the laboratory report for the April 11, 2026 sampling on May 12, 2026, due to laboratory delays.

In anticipation of the incoming storm event, stormwater from the upper basins was pumped down to the South Basin on April 11, 2026, which resulted in a discharge into the western inlet of the South Basin. There was no discharge out of the South Basin or into or out of the East Basin as a result of this pumping activity. On April 12, 2026, a storm event began which caused a discharge into the South Basin through the eastern and western inlets. There was no discharge out of the South Basin or into or out of the East Basin as a result of this storm event. Additionally, a separate discharge into the South Basin via the eastern inlet occurred on April 14, 2026, when tank farm basins containing stormwater were pumped to the South Basin. There was no discharge out of the South Basin or into or out of the East Basin as a result of this pumping activity.

Chiquita followed protocol pursuant to its updated Storm Water Pollution Prevention Plan (“SWPPP”) and related best management practices, including those outlined in Section 6.6 of the SWPPP, to minimize and prevent leachate migration with stormwater runoff into onsite discharge channels, drain inlets, and inlets to the Basin. Chiquita also conducted sampling pursuant to Condition 1(j) as discussed below.

The reaction area at the landfill has been covered with more than 60-acres of 30-mil high density polyethylene and 60-mil ethylene vinyl alcohol/high density polyethylene geomembrane cover (“cover”) to reduce landfill surface emissions, prevent soil erosion, and mitigate against leachate commingling with stormwater runoff. Additionally, twice daily inspections are performed of this area to assess the effectiveness of the cover, including identifying any leachate seeps, cover integrity concerns, or stormwater discharges into and out of the Basin. At the time of these discharge events, the cover was observed to be effective at preventing leachate commingling with stormwater runoff, among its other intended purposes.

II. Discharge Sampling Analysis

Condition 1(j) of the Amended Order requires the following:

The Discharger shall sample and submit the analysis of any and all discharges into and out of the south sedimentation basin and east sedimentation basin. Analytes shall include parameters identified in the effluent limitation guidelines in Subchapter N, Subpart B—RCRA Subtitle D Non-Hazardous Waste Landfills, Mpars, parameters the Discharger is required to sample per the Industrial General Permit including TMDL related requirements in Attachment E, and Appendix II constituents. All results must be submitted to the Los Angeles Water Board within 30 days of the first day of the discharge event. Where parameters overlap, or are otherwise duplicative, only a single analysis is required to satisfy the requirements of this Order.

In accordance with Item 1(j) of the Amended Order, Chiquita collected samples on April 11, 2026, representative of the discharge into the South Basin from the western inlet related to the anticipatory pumping in advance of the storm. The results are attached hereto as Attachment A.³ Chiquita also collected samples on the morning of April 12, 2026, representative of the discharge into the South Basin from both the western and eastern inlets due to the storm. The results are attached hereto as Attachment B. Chiquita also collected samples on April 14, 2026,

³ As previously mentioned, Chiquita received the laboratory report for the April 11, 2026 sampling on May 12, 2026, due to laboratory delays.

representative of the discharge into the South Basin from the eastern inlet related to the pumping activity from the tank farm basins. The results are attached hereto as Attachment C.

During storm events, stormwater runoff enters the two-stage South Basin via the eastern and/or western inlets prior to any potential discharge. The two-stage South Basin is designed to fully capture runoff from typical storm events, which allows for sedimentation of suspended solids and other contaminants associated with suspended solids. Clarified stormwater typically either evaporates, infiltrates, or is used for dust suppression. As approved by the Regional Board in January 2025 and further outlined in Section 4 of the SWPPP, clarified stormwater from the second stage—depending on the circumstances and weather forecasts—may be discharged manually utilizing a pump to allow for controlled discharge and give capacity for runoff from future storm events. During non-typical intense or prolonged storm events, stormwater runoff may also discharge off-site via gravity.

As previously communicated with the Regional Board, Chiquita continues to have significant concerns with the Reporting Limits and related monitoring obligations under the Amended Order. As a result, Chiquita filed its Petition for Review and Request for Stay of Order and Hearing related to compliance with the Amended Order to the State Water Quality Control Board on March 13, 2026.

¹ MDL is the minimum measured concentration of a substance that can be reported with 99% confidence that the measured concentration is distinguishable from method blank results. Definition and Procedure for the Determination of the Method Detection Limit, Revision 2, 40CFR, Part 136, Appendix B, EPA 821-R-16-006, December 2016. Values are based upon our default extraction volume/amount and are subject to change.

² RL is the lowest level that can be reliably determined within specified limits of precision and accuracy during routine laboratory operating conditions. (The RL cannot be lower than the lowest calibration standard used in the initial calibration of the instrument and must be greater than the MDL.) Values are based upon our default extraction volume/amount and are subject to change.

NOTES: * STLC and TCLP extractions require 2 days to complete; therefore, all TATs begin after the extraction is completed (i.e., One-day TAT yields results in 3 days from sample submission).

- ISM prep requires 5 to 10 days to complete; therefore, all TATs begin after the extraction is completed (i.e., One-day TAT yields results in 6 to 11 days from sample submission). Due date listed on WO summary will not accurately reflect the time needed for sample preparation.

- Organic extracts are held for 40 days before disposal; Inorganic extract are held for 30 days.

- MAI assumes that all material present in the provided sampling container is considered part of the sample - MAI does not exclude any material from the sample prior to sample preparation unless requested in writing by the client.

U** = An unpreserved container was received for a method that suggests a preservation in order to extend hold time for analysis.

Case Narrative

Sample Condition on Receipt:

One water sample was received and stored securely in accordance with Onterris - EDH standard operating procedures and EPA methodology. The sample was received in good condition and within the method temperature requirements.

Analytical Notes:

EPA Method 8290A

The sample was extracted and analyzed for 2,3,7,8-TCDD by EPA Method 8290A using a ZB-DIOXIN GC column.

Holding Times

The method holding time criteria was met for the sample.

Quality Control

The Initial Calibration and Continuing Calibration Verifications met the method acceptance criteria.

A Method Blank and Ongoing Precision and Recovery (OPR) sample were extracted and analyzed with the preparation batch. No analytes were detected above the sample quantitation limits in the Method Blank. The OPR recoveries were within the method acceptance criteria.

Labeled standard recoveries for all QC and field samples were within method acceptance criteria.

Volatile Organics by GC/MS (EPA 8260B):

- SOUTH BASIN - WESTERN INLET (lab # 557419-001) and SOUTH BASIN - EASTERN INLET (lab # 557419-002) had pH greater than 2.
- No other analytical problems were encountered.

Semivolatile Organics by GC/MS (EPA 8270E):

No analytical problems were encountered.

Semivolatile Organics by GC/MS (EPA 625.1):

- High response was observed for benzoic acid in the CCV analyzed 04/13/26 13:25; this analyte was not detected at or above the RL in the associated samples, and affected data was qualified with "b".
- Low surrogate recovery was observed for phenol-d6 in SOUTH BASIN - WESTERN INLET (lab # 557419-001).
- Low surrogate recovery was observed for terphenyl-d14 in SOUTH BASIN - WESTERN INLET (lab # 557419-001).
- No other analytical problems were encountered.

Semivolatile Organics by GC/MS SIM (EPA 8270C-SIM):

No analytical problems were encountered.

Pesticides (EPA 8081A):

No analytical problems were encountered.

Total Organic Carbon by IR (SM 5310B):

No analytical problems were encountered.

PCBs (EPA 8082):

No analytical problems were encountered.

Metals (EPA 200.7, EPA 200.8, and EPA 245.1):

- Low recoveries were observed for boron in the MS/MSD of SOUTH BASIN - WESTERN INLET (lab # 557419-001); the LCS was within limits, and the associated RPD was within limits.
- Barium, nickel, and antimony were detected between the MDL and the RL in the method blank for batch 400642; these analytes were either not detected in samples at or above the RL, or detected at a level at least 10 times that of the blank.
- No other analytical problems were encountered.

Ion Chromatography (EPA 300.0):

- High recoveries were observed for a number of analytes in the MS of SOUTH BASIN - WESTERN INLET (lab # 557418-001); the LCS was within limits, and the associated RPDs were within limits.
- Responses exceeding the instrument's linear range were observed for sulfate in the MS/MSD of SOUTH BASIN - WESTERN INLET (lab # 557418-001); affected data was qualified with "E".
- No other analytical problems were encountered.

Conductivity (SM2510B):

No analytical problems were encountered.

Total Oil & Grease (HEM) (EPA 1664A):

- Matrix spikes were not performed for this analysis due to insufficient sample volume.
- No analytical problems were encountered.

Total Phenolics (EPA 420.1):

No analytical problems were encountered.

Alkalinity (SM2320B):

No analytical problems were encountered.

Sulfide (SM 4500-S2-D):

Total Suspended Solids (TSS) (SM2540D):

- High RPD was observed for total suspended solids in the SDUP for batch 400598; the parent sample was not a project sample.
- No other analytical problems were encountered.

Chemical Oxygen Demand (SM5220D):

No analytical problems were encountered.

Biochemical Oxygen Demand (SM5210B):

No analytical problems were encountered.

Turbidity (SM2130B):

No analytical problems were encountered.

Cyanide - Semi-Automated Method (SM 4500-CN-E and SM 4500-CN-E):

No analytical problems were encountered.

Coliform - 9221 Tests (SM 9221B and SM 9221F):

No analytical problems were encountered.

Ammonia and TKN- Semi-Automated Method (SM 4500-NH3-G):

- The 2nd source standard for ammonia was expired. To meet the hold time and TAT, the standard was used for the analysis of NH₃. The ICV was analyzed against the ICAL primary source. Additionally, both the LCS primary source recovery and the secondary source recovery were within acceptance criteria. Therefore, the data quality was not impacted, and the results have been reported. In addition, [557148-003] for [Ammonia] was received in the correct container with the correct preservative. However, the preservation was insufficient as defined by the method. This sample was adjusted in the lab, prior to analysis to a [pH <2] with [0.2 mL] of [H₂SO₄ S27044] per method and SOP. Insufficient preservation may contribute to a low bias result.
- No analytical problems were encountered.

Organophosphorus Pesticides (EPA 8141A):

Pace Laboratories in Bakersfield, CA performed the analysis (see sublab report section for certifications). Please see the Pace Laboratories case narrative.

8151A Chlorinated Herbicides (EPA 8151A):

¹ MDL is the minimum measured concentration of a substance that can be reported with 99% confidence that the measured concentration is distinguishable from method blank results. Definition and Procedure for the Determination of the Method Detection Limit, Revision 2, 40CFR, Part 136, Appendix B, EPA 821-R-16-006, December 2016. Values are based upon our default extraction volume/amount and are subject to change.

² RL is the lowest level that can be reliably determined within specified limits of precision and accuracy during routine laboratory operating conditions. (The RL cannot be lower than the lowest calibration standard used in the initial calibration of the instrument and must be greater than the MDL.) Values are based upon our default extraction volume/amount and are subject to change.

NOTES: * STLC and TCLP extractions require 2 days to complete; therefore, all TATs begin after the extraction is completed (i.e., One-day TAT yields results in 3 days from sample submission).

- ISM prep requires 5 to 10 days to complete; therefore, all TATs begin after the extraction is completed (i.e., One-day TAT yields results in 6 to 11 days from sample submission). Due date listed on WO summary will not accurately reflect the time needed for sample preparation.

- Organic extracts are held for 40 days before disposal; Inorganic extract are held for 30 days.

- MAI assumes that all material present in the provided sampling container is considered part of the sample - MAI does not exclude any material from the sample prior to sample preparation unless requested in writing by the client.

U** = An unpreserved container was received for a method that suggests a preservation in order to extend hold time for analysis.

Case Narrative

Sample Condition on Receipt:

Two water samples were received and stored securely in accordance with Onterris - EDH standard operating procedures and EPA methodology. The samples were received in good condition and within the method temperature requirements.

Analytical Notes:

EPA Method 8290A

The samples were extracted and analyzed for 2,3,7,8-TCDD by EPA Method 8290A using a ZB-DIOXIN GC column.

The samples contained high solids content and a subsample of each sample was taken for extraction.

Holding Times

The method holding time criteria were met for these samples.

Quality Control

The Initial Calibration and Continuing Calibration Verifications met the method acceptance criteria.

A Method Blank and Ongoing Precision and Recovery (OPR) sample were extracted and analyzed with the preparation batch. No analytes were detected above the sample quantitation limits in the Method Blank. The OPR recoveries were within the method acceptance criteria.

Labeled standard recoveries for all QC and field samples were within method acceptance criteria.

¹ MDL is the minimum measured concentration of a substance that can be reported with 99% confidence that the measured concentration is distinguishable from method blank results. Definition and Procedure for the Determination of the Method Detection Limit, Revision 2, 40CFR, Part 136, Appendix B, EPA 821-R-16-006, December 2016. Values are based upon our default extraction volume/amount and are subject to change.

² RL is the lowest level that can be reliably determined within specified limits of precision and accuracy during routine laboratory operating conditions. (The RL cannot be lower than the lowest calibration standard used in the initial calibration of the instrument and must be greater than the MDL.) Values are based upon our default extraction volume/amount and are subject to change.

NOTES: * STLC and TCLP extractions require 2 days to complete; therefore, all TATs begin after the extraction is completed (i.e., One-day TAT yields results in 3 days from sample submission).

- ISM prep requires 5 to 10 days to complete; therefore, all TATs begin after the extraction is completed (i.e., One-day TAT yields results in 6 to 11 days from sample submission). Due date listed on WO summary will not accurately reflect the time needed for sample preparation.

- Organic extracts are held for 40 days before disposal; Inorganic extract are held for 30 days.

- MAI assumes that all material present in the provided sampling container is considered part of the sample - MAI does not exclude any material from the sample prior to sample preparation unless requested in writing by the client.

U** = An unpreserved container was received for a method that suggests a preservation in order to extend hold time for analysis.

Onterris - EDH Work Order No. 2604141

Case Narrative

Sample Condition on Receipt:

One water sample was received and stored securely in accordance with Onterris - EDH standard operating procedures and EPA methodology. The sample was received in good condition and within the method temperature requirements.

Analytical Notes:

EPA Method 8290A

The sample was extracted and analyzed for 2,3,7,8-TCDD by EPA Method 8290A using a ZB-DIOXIN GC column.

The sample contained high solids content and a subsample of the sample was taken for extraction.

Holding Times

The method holding time criteria were met for these samples.

Quality Control

The Initial Calibration and Continuing Calibration Verifications met the method acceptance criteria.

A Method Blank and Ongoing Precision and Recovery (OPR) sample were extracted and analyzed with the preparation batch. No analytes were detected above the sample quantitation limits in the Method Blank. The OPR recoveries were within the method acceptance criteria.

Labeled standard recoveries for all QC and field samples were within method acceptance criteria.
