[1] MDL is the minimum measured concentration of a substance that can be reported with 99% confidence that the measured concentration is distinguishable from method blank results. Definition and Procedure for the Determination of the Method Detection Limit, Revision 2, 40CFR, Part 136, Appendix B, EPA 821-R-16-006, December 2016. Values are based upon our default extraction volume/amount and are subject to change.

[2] RL is the lowest level that can be reliably determined within specified limits of precision and accuracy during routine laboratory operating conditions. (The RL cannot be lower than the lowest calibration standard used in the initial calibration of the instrument and must be greater than the MDL.) Values are based upon our default extraction volume/amount and are subject to change.

NOTES: * STLC and TCLP extractions require 2 days to complete; therefore, all TATs begin after the extraction is completed (i.e., One-day TAT yields results in 3 days from sample submission).

- ISM prep requires 5 to 10 days to complete; therefore, all TATs begin after the extraction is completed (i.e., One-day TAT yields results in 6 to 11 days from sample submission). Due date listed on WO summary will not accurately reflect the time needed for sample preparation.

- Organic extracts are held for 40 days before disposal; Inorganic extract are held for 30 days.

- MAI assumes that all material present in the provided sampling container is considered part of the sample - MAI does not exclude any material from the sample prior to sample preparation unless requested in writing by the client.

U = An unpreserved container was received for a method that suggests a preservation in order to extend hold time for analysis.**

Enthalpy Analytical - EDH Work Order No. 2602171
Case Narrative

Sample Condition on Receipt:

One water sample was received and stored securely in accordance with Enthalpy Analytical - EDH standard operating procedures and EPA methodology. The sample was received in good condition and within the method temperature requirements.

Analytical Notes:

EPA Method 8290A

The sample was extracted and analyzed for 2,3,7,8-TCDD by EPA Method 8290A using a ZB-DIOXIN GC column.

Holding Times

The method holding time criteria was met for the sample.

Quality Control

The Initial Calibration and Continuing Calibration Verifications met the method acceptance criteria.

A Method Blank and Ongoing Precision and Recovery (OPR) sample were extracted and analyzed with the preparation batch. No analytes were detected above the sample quantitation limits in the Method Blank. The OPR recoveries were within the method acceptance criteria.

Labeled standard recoveries for all QC and field samples were within method acceptance criteria.

[1] MDL is the minimum measured concentration of a substance that can be reported with 99% confidence that the measured concentration is distinguishable from method blank results. Definition and Procedure for the Determination of the Method Detection Limit, Revision 2, 40CFR, Part 136, Appendix B, EPA 821-R-16-006, December 2016. Values are based upon our default extraction volume/amount and are subject to change.

[2] RL is the lowest level that can be reliably determined within specified limits of precision and accuracy during routine laboratory operating conditions. (The RL cannot be lower than the lowest calibration standard used in the initial calibration of the instrument and must be greater than the MDL.) Values are based upon our default extraction volume/amount and are subject to change.

NOTES: * STLC and TCLP extractions require 2 days to complete; therefore, all TATs begin after the extraction is completed (i.e., One-day TAT yields results in 3 days from sample submission).

- ISM prep requires 5 to 10 days to complete; therefore, all TATs begin after the extraction is completed (i.e., One-day TAT yields results in 6 to 11 days from sample submission). Due date listed on WO summary will not accurately reflect the time needed for sample preparation.

- Organic extracts are held for 40 days before disposal; Inorganic extract are held for 30 days.

- MAI assumes that all material present in the provided sampling container is considered part of the sample - MAI does not exclude any material from the sample prior to sample preparation unless requested in writing by the client.

U = An unpreserved container was received for a method that suggests a preservation in order to extend hold time for analysis.**

Results relate only to the samples as received by the laboratory. This report should not be reproduced except in full without the written approval of Enthalpy Analytical -EDH .

Enthalpy Analytical - EDH Work Order No. 2602174
Case Narrative

Sample Condition on Receipt:

One water sample was received and stored securely in accordance with Enthalpy Analytical - EDH standard operating procedures and EPA methodology. The sample was received in good condition and within the method temperature requirements.

Analytical Notes:

EPA Method 8290A

The sample was extracted and analyzed for 2,3,7,8-TCDD by EPA Method 8290A using a ZB-DIOXIN GC column.

Holding Times

The method holding time criteria was met for the sample.

Quality Control

The Initial Calibration and Continuing Calibration Verifications met the method acceptance criteria.

A Method Blank and Ongoing Precision and Recovery (OPR) sample were extracted and analyzed with the preparation batch. No analytes were detected above the sample quantitation limits in the Method Blank. The OPR recoveries were within the method acceptance criteria.

Labeled standard recoveries for all QC and field samples were within method acceptance criteria.

[1] MDL is the minimum measured concentration of a substance that can be reported with 99% confidence that the measured concentration is distinguishable from method blank results. Definition and Procedure for the Determination of the Method Detection Limit, Revision 2, 40CFR, Part 136, Appendix B, EPA 821-R-16-006, December 2016. Values are based upon our default extraction volume/amount and are subject to change.

[2] RL is the lowest level that can be reliably determined within specified limits of precision and accuracy during routine laboratory operating conditions. (The RL cannot be lower than the lowest calibration standard used in the initial calibration of the instrument and must be greater than the MDL.) Values are based upon our default extraction volume/amount and are subject to change.

NOTES: * STLC and TCLP extractions require 2 days to complete; therefore, all TATs begin after the extraction is completed (i.e., One-day TAT yields results in 3 days from sample submission).

- ISM prep requires 5 to 10 days to complete; therefore, all TATs begin after the extraction is completed (i.e., One-day TAT yields results in 6 to 11 days from sample submission). Due date listed on WO summary will not accurately reflect the time needed for sample preparation.

- Organic extracts are held for 40 days before disposal; Inorganic extract are held for 30 days.

- MAI assumes that all material present in the provided sampling container is considered part of the sample - MAI does not exclude any material from the sample prior to sample preparation unless requested in writing by the client.

U = An unpreserved container was received for a method that suggests a preservation in order to extend hold time for analysis.**

Enthalpy Analytical - EDH Work Order No. 2602172
Case Narrative

Sample Condition on Receipt:

Two water samples were received and stored securely in accordance with Enthalpy Analytical - EDH standard operating procedures and EPA methodology. The samples were received in good condition and within the method temperature requirements.

Analytical Notes:

EPA Method 8290A

These samples were extracted and analyzed for 2,3,7,8-TCDD by EPA Method 8290A using a ZB-DIOXIN GC column.

Holding Times

The method holding time criteria were met for these samples.

Quality Control

The Initial Calibration and Continuing Calibration Verifications met the method acceptance criteria.

A Method Blank and Ongoing Precision and Recovery (OPR) sample were extracted and analyzed with the preparation batch. No analytes were detected above the sample quantitation limits in the Method Blank. The OPR recoveries were within the method acceptance criteria.

Labeled standard recoveries for all QC and field samples were within method acceptance criteria.

[1] MDL is the minimum measured concentration of a substance that can be reported with 99% confidence that the measured concentration is distinguishable from method blank results. Definition and Procedure for the Determination of the Method Detection Limit, Revision 2, 40CFR, Part 136, Appendix B, EPA 821-R-16-006, December 2016. Values are based upon our default extraction volume/amount and are subject to change.

[2] RL is the lowest level that can be reliably determined within specified limits of precision and accuracy during routine laboratory operating conditions. (The RL cannot be lower than the lowest calibration standard used in the initial calibration of the instrument and must be greater than the MDL.) Values are based upon our default extraction volume/amount and are subject to change.

NOTES: * STLC and TCLP extractions require 2 days to complete; therefore, all TATs begin after the extraction is completed (i.e., One-day TAT yields results in 3 days from sample submission).

- ISM prep requires 5 to 10 days to complete; therefore, all TATs begin after the extraction is completed (i.e., One-day TAT yields results in 6 to 11 days from sample submission). Due date listed on WO summary will not accurately reflect the time needed for sample preparation.

- Organic extracts are held for 40 days before disposal; Inorganic extract are held for 30 days.

- MAI assumes that all material present in the provided sampling container is considered part of the sample - MAI does not exclude any material from the sample prior to sample preparation unless requested in writing by the client.

[1] MDL is the minimum measured concentration of a substance that can be reported with 99% confidence that the measured concentration is distinguishable from method blank results. Definition and Procedure for the Determination of the Method Detection Limit, Revision 2, 40CFR, Part 136, Appendix B, EPA 821-R-16-006, December 2016. Values are based upon our default extraction volume/amount and are subject to change.

[2] RL is the lowest level that can be reliably determined within specified limits of precision and accuracy during routine laboratory operating conditions. (The RL cannot be lower than the lowest calibration standard used in the initial calibration of the instrument and must be greater than the MDL.) Values are based upon our default extraction volume/amount and are subject to change.

NOTES: * STLC and TCLP extractions require 2 days to complete; therefore, all TATs begin after the extraction is completed (i.e., One-day TAT yields results in 3 days from sample submission).

- ISM prep requires 5 to 10 days to complete; therefore, all TATs begin after the extraction is completed (i.e., One-day TAT yields results in 6 to 11 days from sample submission). Due date listed on WO summary will not accurately reflect the time needed for sample preparation.

- Organic extracts are held for 40 days before disposal; Inorganic extract are held for 30 days.

- MAI assumes that all material present in the provided sampling container is considered part of the sample - MAI does not exclude any material from the sample prior to sample preparation unless requested in writing by the client.

U = An unpreserved container was received for a method that suggests a preservation in order to extend hold time for analysis.**

Enthalpy Analytical - EDH Work Order No. 2602278
Case Narrative

Sample Condition on Receipt:

Three water samples were received and stored securely in accordance with Enthalpy Analytical - EDH standard operating procedures and EPA methodology. The samples were received in good condition and within the method temperature requirements.

Analytical Notes:

EPA Method 8290A

The samples were extracted and analyzed for 2,3,7,8 TCDD by EPA Method 8290A using a ZB-DIOXIN GC column.

Holding Times

The method holding time criteria were met for these samples.

Quality Control

The Initial Calibration and Continuing Calibration Verifications met the method acceptance criteria.

A Method Blank and Ongoing Precision and Recovery (OPR) sample were extracted and analyzed with the preparation batch. No analytes were detected above the sample quantitation limits in the Method Blank. The OPR recoveries were within the method acceptance criteria.

Labeled standard recoveries for all QC and field samples were within method acceptance criteria.

[1] MDL is the minimum measured concentration of a substance that can be reported with 99% confidence that the measured concentration is distinguishable from method blank results. Definition and Procedure for the Determination of the Method Detection Limit, Revision 2, 40CFR, Part 136, Appendix B, EPA 821-R-16-006, December 2016. Values are based upon our default extraction volume/amount and are subject to change.

[2] RL is the lowest level that can be reliably determined within specified limits of precision and accuracy during routine laboratory operating conditions. (The RL cannot be lower than the lowest calibration standard used in the initial calibration of the instrument and must be greater than the MDL.) Values are based upon our default extraction volume/amount and are subject to change.

- ISM prep requires 5 to 10 days to complete; therefore, all TATs begin after the extraction is completed (i.e., One-day TAT yields results in 6 to 11 days from sample submission). Due date listed on WO summary will not accurately reflect the time needed for sample preparation.

- Organic extracts are held for 40 days before disposal; Inorganic extract are held for 30 days.

- MAI assumes that all material present in the provided sampling container is considered part of the sample - MAI does not exclude any material from the sample prior to sample preparation unless requested in writing by the client.

U = An unpreserved container was received for a method that suggests a preservation in order to extend hold time for analysis.**

Enthalpy Analytical - EDH Work Order No. 2602174
Case Narrative

Sample Condition on Receipt:

One water sample was received and stored securely in accordance with Enthalpy Analytical - EDH standard operating procedures and EPA methodology. The sample was received in good condition and within the method temperature requirements.

Analytical Notes:

EPA Method 8290A

The sample was extracted and analyzed for 2,3,7,8-TCDD by EPA Method 8290A using a ZB-DIOXIN GC column.

Holding Times

The method holding time criteria was met for the sample.

Quality Control

The Initial Calibration and Continuing Calibration Verifications met the method acceptance criteria.

A Method Blank and Ongoing Precision and Recovery (OPR) sample were extracted and analyzed with the preparation batch. No analytes were detected above the sample quantitation limits in the Method Blank. The OPR recoveries were within the method acceptance criteria.

Labeled standard recoveries for all QC and field samples were within method acceptance criteria.

Forgot to mention earlier that the labels for the eastern inlet say 1220 when they should say 0020. The COC is correct.

Good morning Dave,

There was a discharge into the South Basin from both inlets overnight, so we pulled two SW samples early this morning. They will be delivered with yesterday's samples before the lab opens this morning.

I've attached the COCs.

Best,
Matt

[1] MDL is the minimum measured concentration of a substance that can be reported with 99% confidence that the measured concentration is distinguishable from method blank results. Definition and Procedure for the Determination of the Method Detection Limit, Revision 2, 40CFR, Part 136, Appendix B, EPA 821-R-16-006, December 2016. Values are based upon our default extraction volume/amount and are subject to change.

[2] RL is the lowest level that can be reliably determined within specified limits of precision and accuracy during routine laboratory operating conditions. (The RL cannot be lower than the lowest calibration standard used in the initial calibration of the instrument and must be greater than the MDL.) Values are based upon our default extraction volume/amount and are subject to change.

Case Narrative

Sample Condition on Receipt:

Two water samples were received and stored securely in accordance with Onterris - EDH standard operating procedures and EPA methodology. The samples were received in good condition and within the method temperature requirements.

Analytical Notes:

EPA Method 8290A

The samples were extracted and analyzed for 2,3,7,8-TCDD by EPA Method 8290A using a ZB-DIOXIN GC column.

Holding Times

The method holding time criteria were met for these samples.

Quality Control

The Initial Calibration and Continuing Calibration Verifications met the method acceptance criteria.

A Method Blank and Ongoing Precision and Recovery (OPR) sample were extracted and analyzed with the preparation batch. No analytes were detected above the sample quantitation limits in the Method Blank. The OPR recoveries were within the method acceptance criteria.

Labeled standard recoveries for all QC and field samples were within method acceptance criteria.

[1] MDL is the minimum measured concentration of a substance that can be reported with 99% confidence that the measured concentration is distinguishable from method blank results. Definition and Procedure for the Determination of the Method Detection Limit, Revision 2, 40CFR, Part 136, Appendix B, EPA 821-R-16-006, December 2016. Values are based upon our default extraction volume/amount and are subject to change.

[2] RL is the lowest level that can be reliably determined within specified limits of precision and accuracy during routine laboratory operating conditions. (The RL cannot be lower than the lowest calibration standard used in the initial calibration of the instrument and must be greater than the MDL.) Values are based upon our default extraction volume/amount and are subject to change.

Onterris - EDH Work Order No. 2604065
Case Narrative

Sample Condition on Receipt:

Four water samples were received and stored securely in accordance with Onterris - EDH standard operating procedures and EPA methodology. The samples were received in good condition and within the method temperature requirements. As directed, samples "CCLSB02260402 - HOLD" and "CCLSB04260402 - HOLD" were put on hold.

Analytical Notes:

EPA Method 8290A

The samples were extracted and analyzed for 2,3,7,8-TCDD by EPA Method 8290A using a ZB-DIOXIN GC column.

Holding Times

The method holding time criteria were met for these samples.

Quality Control

The Initial Calibration and Continuing Calibration Verifications met the method acceptance criteria.

A Method Blank and Ongoing Precision and Recovery (OPR) sample were extracted and analyzed with the preparation batch. No analytes were detected above the sample quantitation limits in the Method Blank. The OPR recoveries were within the method acceptance criteria.

Labeled standard recoveries for all QC and field samples were within method acceptance criteria.

- Sodium was detected between the MDL and the RL in the method blank for batch 400577; this analyte was detected in the sample at a level at least 10 times that of the blank.
- Barium and nickel were detected between the MDL and the RL in the method blank for batch 400579; these analytes were detected in the sample at a level at least 10 times that of the blank.
- No other analytical problems were encountered.

Ion Chromatography (EPA 300.0):

[1] MDL is the minimum measured concentration of a substance that can be reported with 99% confidence that the measured concentration is distinguishable from method blank results. Definition and Procedure for the Determination of the Method Detection Limit, Revision 2, 40CFR, Part 136, Appendix B, EPA 821-R-16-006, December 2016. Values are based upon our default extraction volume/amount and are subject to change.

[2] RL is the lowest level that can be reliably determined within specified limits of precision and accuracy during routine laboratory operating conditions. (The RL cannot be lower than the lowest calibration standard used in the initial calibration of the instrument and must be greater than the MDL.) Values are based upon our default extraction volume/amount and are subject to change.

Case Narrative

Sample Condition on Receipt:

One water sample was received and stored securely in accordance with Onterris - EDH standard operating procedures and EPA methodology. The sample was received in good condition and within the method temperature requirements.

Analytical Notes:

EPA Method 8290A

The sample was extracted and analyzed for 2,3,7,8-TCDD by EPA Method 8290A using a ZB-DIOXIN GC column.

Holding Times

The method holding time criteria was met for the sample.

Quality Control

The Initial Calibration and Continuing Calibration Verifications met the method acceptance criteria.

A Method Blank and Ongoing Precision and Recovery (OPR) sample were extracted and analyzed with the preparation batch. No analytes were detected above the sample quantitation limits in the Method Blank. The OPR recoveries were within the method acceptance criteria.

Labeled standard recoveries for all QC and field samples were within method acceptance criteria.

Volatile Organics by GC/MS (EPA 8260B):

- SOUTH BASIN - WESTERN INLET (lab # 557419-001) and SOUTH BASIN - EASTERN INLET (lab # 557419-002) had pH greater than 2.
- No other analytical problems were encountered.

Semivolatile Organics by GC/MS (EPA 8270E):

No analytical problems were encountered.

Semivolatile Organics by GC/MS (EPA 625.1):

- High response was observed for benzoic acid in the CCV analyzed 04/13/26 13:25; this analyte was not detected at or above the RL in the associated samples, and affected data was qualified with "b".
- Low surrogate recovery was observed for phenol-d6 in SOUTH BASIN - WESTERN INLET (lab # 557419-001).
- Low surrogate recovery was observed for terphenyl-d14 in SOUTH BASIN - WESTERN INLET (lab # 557419-001).
- No other analytical problems were encountered.

Semivolatile Organics by GC/MS SIM (EPA 8270C-SIM):

No analytical problems were encountered.

Pesticides (EPA 8081A):

No analytical problems were encountered.

Total Organic Carbon by IR (SM 5310B):

No analytical problems were encountered.

PCBs (EPA 8082):

No analytical problems were encountered.

Metals (EPA 200.7, EPA 200.8, and EPA 245.1):

- Low recoveries were observed for boron in the MS/MSD of SOUTH BASIN - WESTERN INLET (lab # 557419-001); the LCS was within limits, and the associated RPD was within limits.
- Barium, nickel, and antimony were detected between the MDL and the RL in the method blank for batch 400642; these analytes were either not detected in samples at or above the RL, or detected at a level at least 10 times that of the blank.
- No other analytical problems were encountered.

Ion Chromatography (EPA 300.0):

- High recoveries were observed for a number of analytes in the MS of SOUTH BASIN - WESTERN INLET (lab # 557418-001); the LCS was within limits, and the associated RPDs were within limits.
- Responses exceeding the instrument's linear range were observed for sulfate in the MS/MSD of SOUTH BASIN - WESTERN INLET (lab # 557418-001); affected data was qualified with "E".
- No other analytical problems were encountered.

Conductivity (SM2510B):
No analytical problems were encountered.

Total Oil & Grease (HEM) (EPA 1664A):

- Matrix spikes were not performed for this analysis due to insufficient sample volume.
- No analytical problems were encountered.

Total Phenolics (EPA 420.1):

Coliform - 9221 Tests (SM 9221B and SM 9221F):
No analytical problems were encountered.

Ammonia and TKN- Semi-Automated Method (SM 4500-NH3-G):

- The 2nd source standard for ammonia was expired. To meet the hold time and TAT, the standard was used for the analysis of NH3. The ICV was analyzed against the ICAL primary source. Additionally, both the LCS primary source recovery and the secondary source recovery were within acceptance criteria. Therefore, the data quality was not impacted, and the results have been reported. In addition, [557148-003] for [Ammonia] was received in the correct container with the correct preservative. However, the preservation was insufficient as defined by the method. This sample was adjusted in the lab, prior to analysis to a [pH <2] with [0.2 mL] of [H2SO4 S27044] per method and SOP. Insufficient preservation may contribute to a low bias result.
- No analytical problems were encountered.

Organophosphorus Pesticides (EPA 8141A):
Pace Laboratories in Bakersfield, CA performed the analysis (see sublab report section for certifications). Please see the Pace Laboratories case narrative.

8151A Chlorinated Herbicides (EPA 8151A):

[1] MDL is the minimum measured concentration of a substance that can be reported with 99% confidence that the measured concentration is distinguishable from method blank results. Definition and Procedure for the Determination of the Method Detection Limit, Revision 2, 40CFR, Part 136, Appendix B, EPA 821-R-16-006, December 2016. Values are based upon our default extraction volume/amount and are subject to change.

[2] RL is the lowest level that can be reliably determined within specified limits of precision and accuracy during routine laboratory operating conditions. (The RL cannot be lower than the lowest calibration standard used in the initial calibration of the instrument and must be greater than the MDL.) Values are based upon our default extraction volume/amount and are subject to change.

Onterris - EDH Work Order No. 2604127
Case Narrative

Sample Condition on Receipt:

Two water samples were received and stored securely in accordance with Onterris - EDH standard operating procedures and EPA methodology. The samples were received in good condition and within the method temperature requirements.

Analytical Notes:

EPA Method 8290A

The samples were extracted and analyzed for 2,3,7,8-TCDD by EPA Method 8290A using a ZB-DIOXIN GC column.

The samples contained high solids content and a subsample of each sample was taken for extraction.

Holding Times

The method holding time criteria were met for these samples.

Quality Control

The Initial Calibration and Continuing Calibration Verifications met the method acceptance criteria.

A Method Blank and Ongoing Precision and Recovery (OPR) sample were extracted and analyzed with the preparation batch. No analytes were detected above the sample quantitation limits in the Method Blank. The OPR recoveries were within the method acceptance criteria.

Labeled standard recoveries for all QC and field samples were within method acceptance criteria.

[1] MDL is the minimum measured concentration of a substance that can be reported with 99% confidence that the measured concentration is distinguishable from method blank results. Definition and Procedure for the Determination of the Method Detection Limit, Revision 2, 40CFR, Part 136, Appendix B, EPA 821-R-16-006, December 2016. Values are based upon our default extraction volume/amount and are subject to change.

[2] RL is the lowest level that can be reliably determined within specified limits of precision and accuracy during routine laboratory operating conditions. (The RL cannot be lower than the lowest calibration standard used in the initial calibration of the instrument and must be greater than the MDL.) Values are based upon our default extraction volume/amount and are subject to change.

- ISM prep requires 5 to 10 days to complete; therefore, all TATs begin after the extraction is completed (i.e., One-day TAT yields results in 6 to 11 days from sample submission). Due date listed on WO summary will not accurately reflect the time needed for sample preparation.

- Organic extracts are held for 40 days before disposal; Inorganic extract are held for 30 days.

- MAI assumes that all material present in the provided sampling container is considered part of the sample - MAI does not exclude any material from the sample prior to sample preparation unless requested in writing by the client.

U = An unpreserved container was received for a method that suggests a preservation in order to extend hold time for analysis.**

Case Narrative

Sample Condition on Receipt:

One water sample was received and stored securely in accordance with Onterris - EDH standard operating procedures and EPA methodology. The sample was received in good condition and within the method temperature requirements.

Analytical Notes:

EPA Method 8290A

The sample was extracted and analyzed for 2,3,7,8-TCDD by EPA Method 8290A using a ZB-DIOXIN GC column.

The sample contained high solids content and a subsample of the sample was taken for extraction.

Holding Times

The method holding time criteria were met for these samples.

Quality Control

The Initial Calibration and Continuing Calibration Verifications met the method acceptance criteria.

A Method Blank and Ongoing Precision and Recovery (OPR) sample were extracted and analyzed with the preparation batch. No analytes were detected above the sample quantitation limits in the Method Blank. The OPR recoveries were within the method acceptance criteria.

Labeled standard recoveries for all QC and field samples were within method acceptance criteria.

WASTE DISPOSAL REPORT

CHIQUITA CANYON

April 15, 2026

Mr. Enrique Casas
California Regional Water Quality Control Board
320 West 4th Street
Los Angeles, California 90013

Subject: **First Quarter 2026 Solid Waste Disposal Report**
Chiquita Canyon Landfill (File No. 67-20)
Los Angeles County, California

Dear Mr. Casas:

This is the First Quarter 2026 Solid Waste Disposal Report for the Chiquita Canyon Landfill. This report is required by Monitoring and Reporting Program No. CI-6231 dated December 13, 2018, and Waste Discharge Requirements Order No. R4-2018-0172 File No. 67-020 adopted December 13, 2018. This report covers the period from January, February and March 2026.

A point-by-point discussion of reporting requirements follows:

1. The reports to the Regional Board shall include a map of the site, and shall indicate the area(s) where disposal is taking place or will begin. This map shall be updated quarterly and summarized and submitted with the annual report due February 15 of each year. If a new area is landfilled, it shall be identified in the corresponding quarterly report.

As the Water Board is aware, CCL closed the Chiquita Canyon Landfill to the acceptance of waste effective January 1, 2025. CCL does not receive any waste or beneficial reuse materials, but does continue to dispose of a small quantity of internally generated waste. Enclosed, as Attachment 1 is a drawing showing the locations where CCL disposed of the internally generated waste during the First Quarter 2026.

2. A tabular list of the estimated average monthly quantities and types of materials deposited each month.

As discussed above, the Landfill is now closed to the acceptance of waste.

3. An estimate of remaining capacity (in cubic yards and tons), and the remaining life of the site in years and months.

As discussed above, the Landfill is now closed to the acceptance of waste.

4. A certification that all wastes deposited were deposited in compliance with the Board's requirements, and that no waste was deposited outside the boundaries of the waste management facility as specified in the Board requirements.

During the reporting period, the site was operated in compliance with the Board's requirements and no wastes were deposited outside the boundary of the waste management unit.

5. A description of the location and an estimate of the seepage rate or flow of all known seeps and springs at the site.

No water seeps or springs were discovered during visual monitoring of the landfill conducted in January, February and March 2026.

6. The estimated amount of water used at the waste management area for landscape irrigation, compaction, dust control, etc. (If a source other than potable waste is used, the sources and amounts of water from each source shall also be reported).

During the reporting period, approximately 4,012,596 gallons of water were used for dust control, irrigation, and site operation construction. Water was obtained from Newhall Land and Farming Company from an irrigation line located south of the site near Highway 126.

7. Quantities of liquid pumped from the leachate monitoring sumps and/or extraction wells, including dates of removal, and the ultimate disposition (dust control, returned to landfill, disposal). If no liquid was detected or pumped during the reporting period, a statement to that effect shall be submitted.

Information on quantities of leachate pumped and disposed during the reporting period is enclosed as Attachment 3.

8. The discharger shall report all unacceptable (to this site) wastes inadvertently received at this site and their disposition. The following details shall be included:

a. **The source (if known), including the hauler, of the unacceptable wastes and date received and/or discovered.**
b. **Identification of waste (if known) and the amount of waste.**
c. **The name and address of the hauler who removed the waste from the site.**
d. **The ultimate point of disposal for the waste.**
e. **The discharger's actions to prevent recurrence of the attempted depositing of unacceptable wastes by this source or individual (if applicable). If no unacceptable wastes were received (or discovered) during the month, the report shall so state.**

As discussed above, the Landfill is now closed to the acceptance of waste. Only a small amount of internally generated waste is disposed of at the Landfill, which does not include any unacceptable waste. All internal waste is checked before disposal.

If you should have any questions regarding this report, please do not hesitate to contact me at (661) 257-3655.

I declare under penalty of perjury that the foregoing is true and correct.

Executed on the 15th day of April 2026.

Sincerely,

CHIQUITA CANYON LANDFILL

Subject: **Second Quarter 2026 Solid Waste Disposal Report**
Chiquita Canyon Landfill (File No. 67-20)
Los Angeles County, California

Dear Mr. Casas:

This is the Second Quarter 2026 Solid Waste Disposal Report for the Chiquita Canyon Landfill. This report is required by Monitoring and Reporting Program No. CI-6231 dated December 13, 2018, and Waste Discharge Requirements Order No. R4-2018-0172 File No. 67-020 adopted December 13, 2018. This report covers the period from April, May and June 2026.

A point-by-point discussion of reporting requirements follows:

1. The reports to the Regional Board shall include a map of the site, and shall indicate the area(s) where disposal is taking place or will begin. This map shall be updated quarterly and summarized and submitted with the annual report due February 15 of each year. If a new area is landfilled, it shall be identified in the corresponding quarterly report.

As the Water Board is aware, CCL closed the Chiquita Canyon Landfill to the acceptance of waste effective January 1, 2025. CCL does not receive any waste or beneficial reuse materials, but does continue to dispose of a small quantity of internally generated waste. Enclosed, as Attachment 1 is a drawing showing the locations where CCL disposed of the internally generated waste during the Second Quarter 2026.

2. A tabular list of the estimated average monthly quantities and types of materials deposited each month.

As discussed above, the Landfill is now closed to the acceptance of waste.

3. An estimate of remaining capacity (in cubic yards and tons), and the remaining life of the site in years and months.

As discussed above, the Landfill is now closed to the acceptance of waste.

4. A certification that all wastes deposited were deposited in compliance with the Board's requirements, and that no waste was deposited outside the boundaries of the waste management facility as specified in the Board requirements.

During the reporting period, the site was operated in compliance with the Board's requirements and no wastes were deposited outside the boundary of the waste management unit.

5. A description of the location and an estimate of the seepage rate or flow of all known seeps and springs at the site.

No water seeps or springs were discovered during visual monitoring of the landfill conducted in April, May and June 2026.

6. The estimated amount of water used at the waste management area for landscape irrigation, compaction, dust control, etc. (If a source other than potable waste is used, the sources and amounts of water from each source shall also be reported).

During the reporting period, approximately 5,171,208 gallons of water were used for dust control, irrigation, and site operation construction. Water was obtained from Newhall Land and Farming Company from an irrigation line located south of the site near Highway 126.

7. Quantities of liquid pumped from the leachate monitoring sumps and/or extraction wells, including dates of removal, and the ultimate disposition (dust control, returned to landfill, disposal). If no liquid was detected or pumped during the reporting period, a statement to that effect shall be submitted.

Information on quantities of leachate pumped and disposed during the reporting period is enclosed as Attachment 3.

8. The discharger shall report all unacceptable (to this site) wastes inadvertently received at this site and their disposition. The following details shall be included:

a. **The source (if known), including the hauler, of the unacceptable wastes and date received and/or discovered.**
b. **Identification of waste (if known) and the amount of waste.**
c. **The name and address of the hauler who removed the waste from the site.**
d. **The ultimate point of disposal for the waste.**
e. **The discharger's actions to prevent recurrence of the attempted depositing of unacceptable wastes by this source or individual (if applicable). If no unacceptable wastes were received (or discovered) during the month, the report shall so state.**

As discussed above, the Landfill is now closed to the acceptance of waste. Only a small amount of internally generated waste is disposed of at the Landfill, which does not include any unacceptable waste. All internal waste is checked before disposal.

If you should have any questions regarding this report, please do not hesitate to contact me at (661) 257-3655.

I declare under penalty of perjury that the foregoing is true and correct.

Executed on the 15th day of July 2026.

Please do not hesitate to contact me at with any questions regarding the above responses.

Sincerely,

CHIQUITA CANYON LANDFILL

SPECIAL WASTE REPORT

APPENDIX J

WASTE ACCEPTANCE REPORT

FIRST SEMIANNUAL 2026

The California Regional Water Quality Control Board, Los Angeles Region (RWQCB) adopted Order No. R4-2011-0052 (Order) in March 2011 which amended the waste discharge requirements (WDRs) for the Chiquita Canyon Landfill (CCL). The Order serves as the WDRs for the "disposal of non-designated/non-hazardous contaminated soils and the onsite use of non-hazardous contaminated soils or related wastes" at municipal solid waste (MSW) landfills. The Order defines "contaminated soils" as soils that are impacted by pollutants listed in the WDRs, but in low enough concentrations that the soil is not a designated or hazardous waste.

In compliance with the Order, CCL submitted an updated Waste Acceptance Plan (WAP) (revised April 29, 2011) to the RWQCB Executive Officer for approval. The WAP describes the procedures that have been implemented at CCL for obtaining and approving soil profiling information, testing procedures for waste constituents accepted, site-specific threshold levels for all appropriate wastes accepted (for disposal or reuse), and a description of the personnel responsible for implementing the plan. CCL's Special Waste reporting requirements are described in Section 3.0 of the WAP.

This document provides the Special Waste acceptance and disposal information for the fourth quarter of 2025 and the first quarter of 2026 (October 2025 – March 2026) as described in the WAP, and as required by Section F (Reporting Requirements) of the Order. Data collected during the second and third quarters of 2026 (April 2026 – September 2026) will be included in the second semiannual report for 2026 (due January 31, 2027).

Each of the specific reporting requirements, as specified in Section F of the Order, is addressed in the following paragraphs:

1. The report shall include a summary of the types, volumes and disposal or onsite use for all wastes accepted pursuant to the requirements of the Order.

During the reporting period (October 1, 2025 through March 31, 2026), approximately 993 tons of Special Waste were disposed and/or use at CCL. Table 1 summarizes the types and volumes of wastes accepted and identifies the final disposition of the wastes (disposal or beneficial use). All 993 tons of Special Waste were site generated and used or disposed of within the active portion of the lined landfill. No Special Waste were accepted from outside sources.

2. The report shall include a compilation of all waste profiling information utilized by CCL to implement the program requirements including all sampling, measurement and analytical results including:

- **Date, exact place and time of the sampling or measurement;**
- **Individual(s) who did the sampling or measurement;**
- **Date(s) the analyses were done;**
- **Analyses names;**
- **Analytical techniques or methods used to profile contaminated soils or wastes.**

As described in Section 1.4 of the WAP, Special Wastes are defined as wastes that require analysis and testing (profiling) prior to acceptance due to their component make-up. CCL maintains a working knowledge of waste received using two approaches: 1) prequalification of specific wastes prior to transport to the facility, and 2) evaluation of waste loads received at the facility. The prequalification process includes the following components:

1) Each generator of a Special Waste is required to complete and certify a Special Waste Profile form, or a similar form, prior to the initial shipment of their wastes to CCL. The profile form includes generator, customer and transporter information, as well as a waste stream description (common name of material or waste stream, description of the process generating the waste, and waste characteristics), and generator certification.

2) The CCL Special Waste Coordinator (SWC) will evaluate the profile form along with other required documentation to determine whether the waste stream is acceptable. Additional documentation includes certified analytical reports (CARs) and chain of custody documentation (COCs) from a California Department of Health Services (DHS) Accredited Environmental Laboratory, special waste (non-hazardous) manifests, Material Safety Data Sheet(s), and a description of the process(es) generating the waste.

3) The SWC will determine whether correct and sufficient information has been provided by the generator and whether the waste stream is within CCL's acceptance criteria. The SWC will communicate with the generator regarding specific concerns, or missing or incomplete information.

4) If the waste stream is deemed acceptable for use and/or disposal at CCL, the SWC identifies the approved "disposal method," defines any special handling instructions for the waste, and assigns a unique Special Waste Profile Approval Number to the waste stream. The approval number, which is unique to the generator and the waste stream, allows CCL to electronically track the incoming wastes and the associated documentation for each waste stream. Each approval number (and profile form) is dated and given an expiration date, depending on the type of waste and the generating process(es).

The landfill is closed. There was no new special profiles during the reporting period.
