1.0 INTRODUCTION

On behalf of Chiquita Canyon, LLC (CCL), Chang Environmental has prepared this Semiannual Groundwater Monitoring Report for the Chiquita Canyon Landfill. This report includes the First and Second Quarters 2026 Detection Monitoring Program (DMP), Evaluation Monitoring Program (EMP), and Corrective Action Program (CAP) Groundwater Monitoring Report for the reporting period of January through June 2026. The primary purpose of this report is to provide groundwater quality data collected pursuant to Waste Discharge Requirements (WDRs) Order No. R4-2018-0172, issued by the California Regional Water Quality Control Board – Los Angeles Region (RWQCB). This report also includes the Waste Acceptance Report for the Fourth Quarter of 2026 and First Quarter of 2026, as described in CCL's Waste Acceptance Plan (EnviroSolve Corporation, 2011), which was submitted to meet the requirements of RWQCB Order No. R4-2011-0052.

1.1 Summary of Non-Compliance and Corrective Actions

Pursuant to Section B.1.b of the Monitoring and Reporting Program (No, CI-6231), CCL is required to provide details of the compliance record and corrective actions taken or planned during the reporting period. CCL received the following orders during the reporting period:

- Investigative Order No. R4-2024-0010-A01 (as amended on February 11, 2026). The Order was withdrawn except for enforcement purposes on June 12, 2026.
- Investigative Order No. R4-2026-0156 (issued June 12, 2026).

CCL did not receive any notices of violation from the RWQCB during the January 1 through June 30, 2026 reporting period. However, the following corrective actions were taken during the current reporting period in response to prior orders or notices of violation:

- Pursuant to Investigative Order No. R4-2024-0010-A01 (as amended on February 11, 2026) and Investigative Order No. R4-2026-0156 (issued June 12, 2026), respectively, CCL has continued to submit Quarterly Groundwater EMP Reports and Quarterly Liner and LCRS Integrity Reports. In addition, CCL has been submitting 30-day reports to the RWQCB following storm events that have resulted in a discharge into or out of the east and south detention basins, and in accordance with the Investigative Order.
- Pursuant to Investigative Order No. R4-2024-0010-A01 (as amended on February 11, 2026), CCL submitted an updated Stormwater Pollution Prevention Plan on April 19, 2026.
- The RWQCB and USEPA approved controlled discharge from the south detention basin in order for CCL to comply with USEPA's Additional Work Letter for West Toe Improvements, dated March 17, 2026. The discharge was completed on April 22 and was sampled at the discharge point.

1.2 Site Conditions

The Chiquita Canyon Landfill is a Class III solid waste disposal facility owned and operated by CCL. The landfill is in the Santa Clara River basin, approximately three miles west of Castaic Junction in Los Angeles County, California. The landfill includes three disposal areas designated

as Primary Canyon, Canyon B, and Main Canyon. Effective January 1, 2025, the landfill closed active waste disposal operations and is no longer accepting waste.

The site is located at the eastern end of the Ventura Basin within the Transverse Ranges geomorphic province. Sedimentary rock units at and near the site are the Pliocene age Pico Formation and the Plio-Pleistocene age Saugus Formation. The marine sediments of the Pico Formation outcrop in the northwest portion of the site. The Saugus Formation overlies the Pico Formation at the site, and Saugus Formation units extend south and east to the Castaic-Newhall area. The Saugus Formation is composed of interbedded shallow-water marine, brackish water, and nonmarine units. Other geologic materials exposed nearby include terrace deposits of Pleistocene age and Holocene alluvium mantling the valley floor. Groundwater beneath the landfill occurs in the sedimentary bedrock (Pico and Saugus formations) and generally flows southward into the Santa Clara River Valley.

Climate at the site is that of semiarid climate typical of the Transverse Ranges. The entire site is well above the 100-year floodplain based on the Federal Emergency Management Agency Flood Insurance Rate Map (FEMA) for Los Angeles County, California. The 100-year, 24-hour rainfall amount was calculated to be 6.51 inches (Golder, 2017). The site lies in a canyon east of San Martinez Chiquito Canyon and south of Hasley Canyon, and is separated from both by relatively steep ridgelines. The ridgelines define the northern and western boundaries of the site, resulting in minimal contributory drainage areas to the landfill. Surface water runoff within the site's drainage basin is directed to the south and east. Most of the site drains south toward the Santa Clara River, which runs along the southern border of the site. The northeast portion of the site drains eastward into a large unnamed canyon, then southeast into Castaic Creek, approximately 3,000 feet from the site boundary.

1.3 Groundwater Flow Direction and Velocity

Determinations of groundwater flow direction and velocity are based on groundwater elevations measured each quarter. The groundwater elevations, interpreted groundwater elevation contours, and the groundwater flow directions are shown for each quarter in Figures 1 (First Quarter) and 2 (Second Quarter). At each well monitored, groundwater elevations were similar in both quarters, so the groundwater elevation contour maps show similar gradients and flow directions for the periods monitored. East Canyon area could not be accessed during the First Quarter because of the basin construction. Roads were graded and area was accessible for the Second Quarter monitoring event.

Within the Main Canyon area, groundwater flow in the Pico Formation is south, away from the steep topographic ridge to the north. Based on water elevation contours in Figures 1 and 2, a hydraulic gradient of 0.05 feet per feet (ft/ft) was estimated for groundwater in Pico Formation bedrock along the upgradient (north) perimeter of the Main Canyon.

Across the central and southern portion of the site, including all downgradient portions of the waste management units, the uppermost groundwater occurs in the Saugus Formation. Groundwater flow is generally south beneath the Primary Canyon and the Main Canyon, with the exception of flow variations in the vicinity of well DW-17, where higher groundwater elevations indicate a radial flow pattern away from this area. Groundwater beneath Canyon B appears to flow eastward

down the canyon. Water level in well PZ-4 is higher than prior to 2019, likely due to the groundwater recharge from the stormwater basin in the area.

Based on water elevations measured both quarters, a range of hydraulic gradients was calculated for the uppermost water-bearing zone in the Saugus Formation. Groundwater gradients are variable, with the steepest gradients in the vicinity of well DW-17, where the local hydraulic gradient is 0.08 ft/ft southwest towards well DW-16. Across the Primary Canyon and downgradient from the Main Canyon, the estimated hydraulic gradient is 0.03 to 0.07 ft/ft.

A range of hydraulic conductivity values has been measured in the Saugus Formation at the site (EMCON, 1990; RTF&A, 2005c). The best estimate of in-situ hydraulic conductivity is based on slug test results, and ranges from 1.1×10^{-3} centimeters per second (cm/sec) to 1.1×10^{-5} cm/sec. Laboratory results of Saugus Formation samples from the site showed porosity values range from 0.25 to 0.38 (EMCON, 1990). Assuming 75 percent of the pore spaces are interconnected and contributing to effective porosity, the estimated effective porosity is 0.19 to 0.28. Using the range of aquifer properties described above and a hydraulic gradient of approximately 0.05 ft/ft for the POC at the Primary Canyon and the Main Canyon, the calculated linear flow velocity for the Saugus Formation varies from approximately 2.0 to 299 feet per year.

2.1 Groundwater Monitoring Well Network

The groundwater monitoring network consists of 18 monitoring wells (DW-1, DW-3, DW 7, DW-8, DW-9, DW-12, DW-14, DW-15, DW-16, DW-17, DW-18, DW-21, DW-28, DW-29, DW-30, DW-31, FP-01, and PZ-4). Additional points DW 23, DW-24, DW-26, PZ 3, PZ-5, PZ-6, PZ-7, GP-15, GP-16, GP-17, GP 21, GP-22, GP-24, GP-25, and GP-26 are sounded for water levels only. Monitoring points DW-8, DW-25, DW-27, DW-28, PZ-5, PZ-6, GP-25, and GP-26 are completed within the Pico Formation, and the remaining wells and piezometers are monitoring the Saugus Formation.

In accordance with the Investigative Order No. R4-2024-0010, Chiquita placed five existing groundwater monitoring wells (DW-9, DW-15, DW-16, DW-17, and DW-29) and three new monitoring wells (DW-30, DW-31, and FP-01) installed downgradient of the reaction area into an evaluation monitoring program (EMP). Two onsite monitoring wells (DW-30 and DW-31) were installed in September 2024 by Geo-Logic Associates (GLA) pursuant to Investigative Order Item 1(b). One offsite monitoring well (FP-01) was installed in April 2025 by GLA. A well installation report for DW-30, DW- 31, and FP-01 was prepared by GLA and submitted in May 2025. No surface monitoring network is present at the site.

2.2 Description of Monitoring Activities

Sampling and analytical requirements include quarterly and semiannual groundwater monitoring for monitoring parameters specified in the Monitoring and Reporting Program (MRP). Additional monitoring for constituents of concern (COCs) is annually, at five-year intervals, for background sampling for new constituents when new wells are installed, or when "triggered" by the release discovery response process. The latest five-year COC scan was conducted in April 2016 (R. T. Frankian & Associates (RTF&A), 2016b). The COC sampling is currently conducted annually in accordance with the MRP. CCL has complied with Section C (Required Water Quality Monitoring and Inspection Program) of this MRP.

A CAP is in progress at wells DW-1 near Primary Canyon, and DW-3 at Canyon B. Previous CAP well DW-20 was destroyed and replaced with detection well DW-29. Volatile organic compounds (VOCs) have been historically reported in groundwater samples from these wells. Implemented corrective action measures at these disposal areas include landfill gas (LFG) collection and control system improvements aimed at reducing subsurface gas migration to groundwater.

Quarterly monitoring and semiannual reporting are required by the MRP, which contains the requirements for groundwater sampling and analysis, and evaluation of analytical results. The WDR Order No. R4-2018-0173 adopted on December 13, 2018 included the revised MRP No. CI-6231 which changed the reporting periods as follows:

Period	Sampling Month	Reporting
Semiannual		
First	January & April	July 31
Second	July & October	January 31
Annual Summary		
January 1 – December 31		January 31

Eight groundwater monitoring wells (DW-9, DW-15, DW-16, DW-17, DW-29, DW-30, DW-31, and FP-01) are sampled in accordance with Investigative Order R4-2024-0010 (as amended on February 11, 2026) for the current reporting period, and future sampling will be conducted in accordance with the new Investigative Order No. R4-2026-0156. Quarterly monitoring began in April 2024, and the most recent quarterly report was submitted on July 15, 2026.

2.3 Field Procedures for Monitoring Activities

The quarterly groundwater monitoring consisted of the following:

- measuring groundwater levels in all wells;
- collecting quarterly groundwater samples from the EMP/CAP wells DW-1, DW-3, and DW-16
- collecting quarterly groundwater samples from the EMP wells DW-9, DW-15, DW-16, DW-17, DW-29, and new wells DW-30, DW-31, and FP-01 in response to the reaction area
- collecting semiannual groundwater samples from the background monitoring wells DW-8, DW-14, DW-17, and DW-28
- collecting semiannual groundwater samples from the DMP wells DW-7, DW-12, DW-15, DW-18, DW-21, DW-29, and PZ-4; and,
- analyzing these groundwater samples for the site monitoring parameters.

Static water levels in all monitoring network wells were measured using an electric water level sounder prior to purging and sampling. Quarterly water level measurements were collected in January and April. The measurements were recorded on well gauging forms (Appendix A), and the historical calculated elevations are tabulated in Appendix B.

The first quarter groundwater samples for this reporting period were collected in January 2026, and the second quarter samples were collected in April 2026. The low-flow groundwater sampling field data sheets are provided in Appendix A. Field parameters that were monitored and recorded during low-flow purging consist of specific conductance, pH, temperature, dissolved oxygen (DO), and oxygen reduction potential (ORP).

Water samples were kept on ice in coolers and transported to Enthalpy Analytics, a State-certified laboratory, for analysis. The groundwater samples were analyzed for the selected parameters specified in the MRP. As required by MRP No. 6231, analytical results reported as "less than…" (or "nondetect") are reported as less than a numeric value. Both Practical Quantitation Limits (PQLs) and Method Detection Limits (MDLs) are reported for each analyte tested.

Annual leachate sample was collected in September 2025, results of which were reported in the 2025 Annual Summary Report. Retest sampling for select analytes was conducted in March 2026, results of which are discussed below.

3.1 Summary of Results.

The intent of the groundwater monitoring program is to assess groundwater quality and determine whether it is being affected by the landfill. This quarterly assessment of monitoring parameters is made through both nonstatistical and statistical analyses, as described in the WDRs.

The concentration limit analysis for the nonstatistical organic (VOC/SVOC) is a comparison of each detected organic compound with its respective MDL and PQL. Detected organic compounds in samples for this monitoring period are tabulated in Table 1.

The concentration limit analysis of the indicator monitoring parameters for the DMP is the statistical intrawell prediction limit method. This intrawell approach involves using the historical water chemistry for each well as the background data for that well, rather than comparing current water chemistry to data from a different, hydraulically upgradient well. The intrawell background data pool for each well/monitoring parameter was updated prior to the April 2025 monitoring period. The next intrawell background update will be prior to April 2027 monitoring period. The statistical results are summarized in Table 2 and prediction limit plots for each well/indicator monitoring parameter pair are included in Appendix C. The laboratory analytical reports for this reporting period are included in Appendix D. The electronic laboratory analytical results were uploaded to the State GeoTracker website in the required electronic deliverable format (EDF).

3.2 DMP/EMP Groundwater Quality Analysis

The detected organic compound results are summarized in Table 1. Most organic compounds were not detected from the DMP monitoring wells during the current reporting period. VOCs detected include:

- a trace concentration detection of Freon 12 in the April sample from well PZ-4.
- a trace concentration detection of 1,4-dichlorobenzene in the April sample from well DW-15.
- a trace concentration detection of tetrachloroethene in the January and April samples from well DW-30.

In addition, relatively low concentrations of semi-volatile organic compound (SVOC) 1,4-dioxane were detected in the monthly samples from wells DW-31 and FP-01. Because only a trace concentration of a single VOC – below the PQL – was detected in these wells, CCL concluded that these results does not indicate a measurably significant change in the nature or extent of the release (MRP Section (C)(2)(i)(i)(B)).

In general, the analytical results for indicator monitoring parameters and supplemental monitoring parameters are within historical ranges at the site. The statistical analytical results for each monitoring parameter/well pair are presented in Appendix C, and the statistical summary is provided on Table 2. For the monitoring parameters evaluated statistically, alkalinity in well DW-3, ammonia-N and chemical oxygen demand (COD) in well DW-17, and nitrate in wells DW-3 and DW-31 exceeded their respective statistical prediction limit. Of these, alkalinity in well DW-3 and nitrate in well DW-3 are being monitored in Tracking Mode, and therefore, no further action is required. Retest sampling was conducted in July for ammonia-N and COD at well DW-17. For nitrate exceedance at well DW-31 for the April sampling event, subsequent nitrate results

for samples from May and June were below the statistical limit. Using the May and June sample data as "retest" samples, CCL concludes that the nitrate exceedance at well DW-31 is not an indication of a release and will not be monitored in tracking mode.

The landfill release identified at well DW-16 was initially indicated by the presence of trace concentrations of VOCs (TCE and PCE). Trace to low concentrations of various VOCs were present in the January and April 2026 DW-16 samples (Table 1). The proposed EMP evaluation method is to plot VOC concentrations versus time (time-series plots) and evaluate trends (Appendix E). The recent VOC concentrations in samples from DW-16 have remained relatively consistent at low levels of 1.3 μg/L or less. For the monitoring parameters evaluated statistically, there was no exceedance of the statistical prediction limit.

The Investigative Order R4-2024-0010 placed five existing groundwater monitoring wells (DW-9, 15, 16, 17, and 29) and three new monitoring wells (DW-30, DW-31, and FP-01) installed downgradient of the reaction area into the EMP. Quarterly reporting began in April 2024. Quarterly reports for the current monitoring period were submitted on April 15, 2026 and July 15, 2026.

3.3 CAP Groundwater Quality Analysis

As specified in the CAP, the COCs at wells DW-1 and DW-3 are those VOCs identified using USEPA Method 8260, and their concentration limits are the respective MDLs. At well DW-1, the lab reported a trace detection of PCE in the January and April 2026 samples. At well DW-3, trace to low detections of 1,1-Dichloroethane, Freon 12, PCE, and TCE were reported. These results are similar to previous sampling results from these CAP wells.

3.4 Demonstration of CAP Effectiveness

Time-series plots of VOCs detected this reporting period illustrate trends in VOC concentrations through time at well DW-1 and DW-3 (Appendix E). Samples with analyte concentrations less than the MDL ("nondetected") were plotted at one-half the MDL. The VOC concentrations in the DW-1 and DW-3 samples are within historical ranges.

Corrective action measures are continuing to be implemented at the landfill. Corrective action measures at both the Primary Canyon and Canyon B disposal areas include LFG collection and control system improvements aimed at reducing gas migration to groundwater. The LFG collection system appears to be effective at reducing VOC concentrations in groundwater at wells DW-1 and DW-3, so no further changes to the CAP are recommended at this time.

3.5 Leachate Retest Results

The MRP requires sampling of leachate for Appendix II constituents annually in September of each year. If any Appendix II constituent is detected in the leachate sample that is not yet on the site COC list, a retest sample is required in March of the following year. If the retest result confirms the initial detection, the Appendix II constituent is added to the site COC list.

The leachate sample collected in September 2025 detected three VOC compounds, 4-methyl-2-pentanone, 2-butanone, and acetone, plus one semi-VOC compounds phenanthrene above the PQL that are not already on the site COC list. A retest sample was collected in March 2026 to verify these detections, the results of which are included in Appendix D. Acetone and 2-butanone were

detected above the PQL in the retest sample, and therefore, will be added to the site COC list and monitored during the COC sampling events.

4.0 OTHER SITE MONITORING PROGRAMS

During the reporting period, approximately 9,183,804 gallons of water were used for irrigation, site operation construction, and dust control on the roadways as well as other areas of the Landfill with a high potential for fugitive dust. Sampling and analysis of the water used on site for dust control and other purposes is required by the MRP if the water is not considered potable. Quarterly site water samples (JS-1) were collected in January and April 2026, results of which are included in Appendix D.

Quarterly landfill gas monitoring reports are required by the WDRs in order to comply with the vadose-zone monitoring requirements. Landfill gas monitoring reports completed during the current reporting period are included as Appendix F.

Qualifying storm event (QSE) discharge and other required samples were collected from the inlets and outlets of the site's two stormwater sedimentation basins between July 1, 2025 to June 30, 2026. Laboratory reports for these sampling events are included in Appendix G.

The WDR Order No. R4-2011-0052 specified benchmark values were exceeded by the QSE discharge samples for chemical oxygen demand and total iron (Table G-1). These results were previously determined to be not related to stormwater coming in contact with contaminated soil or related waste (RTF&A, 2017). Based on these results, there was no requirement for corrective measures. Stormwater monitoring reports consistent with the site's Industrial General Permit requirements are reported electronically in SMARTS.

5.0 STANDARD OBSERVATIONS

The WDR Order No. R4-2018-0173 requires semiannual reporting of standard observations in accordance with the NPDES Stormwater Permit requirements. The standard observation forms for the current reporting period are included as Appendix H.

6.0 WASTE DISPOSAL REPORTING

The site Waste Disposal Report including monthly waste disposal quantities, remaining capacity estimate, and report of all unacceptable wastes are included as Appendix I. All accepted wastes were deposited in compliance with the RWQCB requirements and no wastes were deposited outside of the boundaries of the waste management area. The landfill is closed effective January 1, 2025, and is no longer accepting waste.

7.0 MANAGEMENT OF LIQUIDS AND SPECIAL WASTE

Semiannual reporting of the managements of leachate and condensate are required and is included as part of the Waste Disposal Report (Appendix I).

As required by RWQCB Order No. R4-2011-0052, CCL submitted a Waste Acceptance Plan (Plan) to the RWQCB for review (EnviroSolve Corporation, 2011). The Waste Acceptance Report under the Plan is attached in Appendix J.

No analytical problems were encountered.

Metals (EPA 6010B):
No analytical problems were encountered.

Ion Chromatography (EPA 300.0):

- High recoveries were observed for a number of analytes in the MS/MSD for batch 392705; the parent sample was not a project sample.
- Responses exceeding the instrument's linear range were observed for chloride and sulfate in the MSs/MSDs for batch 392705; affected data was qualified with "E".
- No other analytical problems were encountered.

Chemical Oxygen Demand by EPA 410.4 (EPA 410.4):
No analytical problems were encountered.

Alkalinity (SM2320B):
No analytical problems were encountered.

Sulfide (SM 4500-S2-D):

[1] MDL is the minimum measured concentration of a substance that can be reported with 99% confidence that the measured concentration is distinguishable from method blank results. Definition and Procedure for the Determination of the Method Detection Limit, Revision 2, 40CFR, Part 136, Appendix B, EPA 821-R-16-006, December 2016. Values are based upon our default extraction volume/amount and are subject to change.

[2] RL is the lowest level that can be reliably determined within specified limits of precision and accuracy during routine laboratory operating conditions. (The RL cannot be lower than the lowest calibration standard used in the initial calibration of the instrument and must be greater than the MDL.) Values are based upon our default extraction volume/amount and are subject to change.

[1] MDL is the minimum measured concentration of a substance that can be reported with 99% confidence that the measured concentration is distinguishable from method blank results. Definition and Procedure for the Determination of the Method Detection Limit, Revision 2, 40CFR, Part 136, Appendix B, EPA 821-R-16-006, December 2016. Values are based upon our default extraction volume/amount and are subject to change.

[2] RL is the lowest level that can be reliably determined within specified limits of precision and accuracy during routine laboratory operating conditions. (The RL cannot be lower than the lowest calibration standard used in the initial calibration of the instrument and must be greater than the MDL.) Values are based upon our default extraction volume/amount and are subject to change.

NOTES: * STLC and TCLP extractions require 2 days to complete; therefore, all TATs begin after the extraction is completed (i.e., One-day TAT yields results in 3 days from sample submission).

- ISM prep requires 5 to 10 days to complete; therefore, all TATs begin after the extraction is completed (i.e., One-day TAT yields results in 6 to 11 days from sample submission). Due date listed on WO summary will not accurately reflect the time needed for sample preparation.

- Organic extracts are held for 40 days before disposal; Inorganic extract are held for 30 days.

- MAI assumes that all material present in the provided sampling container is considered part of the sample - MAI does not exclude any material from the sample prior to sample preparation unless requested in writing by the client.

U = An unpreserved container was received for a method that suggests a preservation in order to extend hold time for analysis.**

[1] MDL is the minimum measured concentration of a substance that can be reported with 99% confidence that the measured concentration is distinguishable from method blank results. Definition and Procedure for the Determination of the Method Detection Limit, Revision 2, 40CFR, Part 136, Appendix B, EPA 821-R-16-006, December 2016. Values are based upon our default extraction volume/amount and are subject to change.

[2] RL is the lowest level that can be reliably determined within specified limits of precision and accuracy during routine laboratory operating conditions. (The RL cannot be lower than the lowest calibration standard used in the initial calibration of the instrument and must be greater than the MDL.) Values are based upon our default extraction volume/amount and are subject to change.

NOTES: * STLC and TCLP extractions require 2 days to complete; therefore, all TATs begin after the extraction is completed (i.e., One-day TAT yields results in 3 days from sample submission).

- ISM prep requires 5 to 10 days to complete; therefore, all TATs begin after the extraction is completed (i.e., One-day TAT yields results in 6 to 11 days from sample submission). Due date listed on WO summary will not accurately reflect the time needed for sample preparation.

- Organic extracts are held for 40 days before disposal; Inorganic extract are held for 30 days.

- MAI assumes that all material present in the provided sampling container is considered part of the sample - MAI does not exclude any material from the sample prior to sample preparation unless requested in writing by the client.

U = An unpreserved container was received for a method that suggests a preservation in order to extend hold time for analysis.**

[1] MDL is the minimum measured concentration of a substance that can be reported with 99% confidence that the measured concentration is distinguishable from method blank results. Definition and Procedure for the Determination of the Method Detection Limit, Revision 2, 40CFR, Part 136, Appendix B, EPA 821-R-16-006, December 2016. Values are based upon our default extraction volume/amount and are subject to change.

[2] RL is the lowest level that can be reliably determined within specified limits of precision and accuracy during routine laboratory operating conditions. (The RL cannot be lower than the lowest calibration standard used in the initial calibration of the instrument and must be greater than the MDL.) Values are based upon our default extraction volume/amount and are subject to change.

NOTES: * STLC and TCLP extractions require 2 days to complete; therefore, all TATs begin after the extraction is completed (i.e., One-day TAT yields results in 3 days from sample submission).

- ISM prep requires 5 to 10 days to complete; therefore, all TATs begin after the extraction is completed (i.e., One-day TAT yields results in 6 to 11 days from sample submission). Due date listed on WO summary will not accurately reflect the time needed for sample preparation.

- Organic extracts are held for 40 days before disposal; Inorganic extract are held for 30 days.

- MAI assumes that all material present in the provided sampling container is considered part of the sample - MAI does not exclude any material from the sample prior to sample preparation unless requested in writing by the client.

U = An unpreserved container was received for a method that suggests a preservation in order to extend hold time for analysis.**

[1] MDL is the minimum measured concentration of a substance that can be reported with 99% confidence that the measured concentration is distinguishable from method blank results. Definition and Procedure for the Determination of the Method Detection Limit, Revision 2, 40CFR, Part 136, Appendix B, EPA 821-R-16-006, December 2016. Values are based upon our default extraction volume/amount and are subject to change.

[2] RL is the lowest level that can be reliably determined within specified limits of precision and accuracy during routine laboratory operating conditions. (The RL cannot be lower than the lowest calibration standard used in the initial calibration of the instrument and must be greater than the MDL.) Values are based upon our default extraction volume/amount and are subject to change.

NOTES: * STLC and TCLP extractions require 2 days to complete; therefore, all TATs begin after the extraction is completed (i.e., One-day TAT yields results in 3 days from sample submission).

- ISM prep requires 5 to 10 days to complete; therefore, all TATs begin after the extraction is completed (i.e., One-day TAT yields results in 6 to 11 days from sample submission). Due date listed on WO summary will not accurately reflect the time needed for sample preparation.

- Organic extracts are held for 40 days before disposal; Inorganic extract are held for 30 days.

- MAI assumes that all material present in the provided sampling container is considered part of the sample - MAI does not exclude any material from the sample prior to sample preparation unless requested in writing by the client.

U = An unpreserved container was received for a method that suggests a preservation in order to extend hold time for analysis.**

[1] MDL is the minimum measured concentration of a substance that can be reported with 99% confidence that the measured concentration is distinguishable from method blank results. Definition and Procedure for the Determination of the Method Detection Limit, Revision 2, 40CFR, Part 136, Appendix B, EPA 821-R-16-006, December 2016. Values are based upon our default extraction volume/amount and are subject to change.

[2] RL is the lowest level that can be reliably determined within specified limits of precision and accuracy during routine laboratory operating conditions. (The RL cannot be lower than the lowest calibration standard used in the initial calibration of the instrument and must be greater than the MDL.) Values are based upon our default extraction volume/amount and are subject to change.

NOTES: * STLC and TCLP extractions require 2 days to complete; therefore, all TATs begin after the extraction is completed (i.e., One-day TAT yields results in 3 days from sample submission).

- ISM prep requires 5 to 10 days to complete; therefore, all TATs begin after the extraction is completed (i.e., One-day TAT yields results in 6 to 11 days from sample submission). Due date listed on WO summary will not accurately reflect the time needed for sample preparation.

- Organic extracts are held for 40 days before disposal; Inorganic extract are held for 30 days.

- MAI assumes that all material present in the provided sampling container is considered part of the sample - MAI does not exclude any material from the sample prior to sample preparation unless requested in writing by the client.

U = An unpreserved container was received for a method that suggests a preservation in order to extend hold time for analysis.**

[1] MDL is the minimum measured concentration of a substance that can be reported with 99% confidence that the measured concentration is distinguishable from method blank results. Definition and Procedure for the Determination of the Method Detection Limit, Revision 2, 40CFR, Part 136, Appendix B, EPA 821-R-16-006, December 2016. Values are based upon our default extraction volume/amount and are subject to change.

[2] RL is the lowest level that can be reliably determined within specified limits of precision and accuracy during routine laboratory operating conditions. (The RL cannot be lower than the lowest calibration standard used in the initial calibration of the instrument and must be greater than the MDL.) Values are based upon our default extraction volume/amount and are subject to change.

[1] MDL is the minimum measured concentration of a substance that can be reported with 99% confidence that the measured concentration is distinguishable from method blank results. Definition and Procedure for the Determination of the Method Detection Limit, Revision 2, 40CFR, Part 136, Appendix B, EPA 821-R-16-006, December 2016. Values are based upon our default extraction volume/amount and are subject to change.

[2] RL is the lowest level that can be reliably determined within specified limits of precision and accuracy during routine laboratory operating conditions. (The RL cannot be lower than the lowest calibration standard used in the initial calibration of the instrument and must be greater than the MDL.) Values are based upon our default extraction volume/amount and are subject to change.

NOTES: *** STLC and TCLP extractions require 2 days to complete; therefore, all TATs begin after the extraction is completed (i.e., One-day TAT yields results in 3 days from sample submission).**

- ISM prep requires 5 to 10 days to complete; therefore, all TATs begin after the extraction is completed (i.e., One-day TAT yields results in 6 to 11 days from sample submission). Due date listed on WO summary will not accurately reflect the time needed for sample preparation.

- Organic extracts are held for 40 days before disposal; Inorganic extract are held for 30 days.

- MAI assumes that all material present in the provided sampling container is considered part of the sample - MAI does not exclude any material from the sample prior to sample preparation unless requested in writing by the client.

U = An unpreserved container was received for a method that suggests a preservation in order to extend hold time for analysis.**

[1] MDL is the minimum measured concentration of a substance that can be reported with 99% confidence that the measured concentration is distinguishable from method blank results. Definition and Procedure for the Determination of the Method Detection Limit, Revision 2, 40CFR, Part 136, Appendix B, EPA 821-R-16-006, December 2016. Values are based upon our default extraction volume/amount and are subject to change.

[2] RL is the lowest level that can be reliably determined within specified limits of precision and accuracy during routine laboratory operating conditions. (The RL cannot be lower than the lowest calibration standard used in the initial calibration of the instrument and must be greater than the MDL.) Values are based upon our default extraction volume/amount and are subject to change.

NOTES: * STLC and TCLP extractions require 2 days to complete; therefore, all TATs begin after the extraction is completed (i.e., One-day TAT yields results in 3 days from sample submission).

- ISM prep requires 5 to 10 days to complete; therefore, all TATs begin after the extraction is completed (i.e., One-day TAT yields results in 6 to 11 days from sample submission). Due date listed on WO summary will not accurately reflect the time needed for sample preparation.

- Organic extracts are held for 40 days before disposal; Inorganic extract are held for 30 days.

- MAI assumes that all material present in the provided sampling container is considered part of the sample - MAI does not exclude any material from the sample prior to sample preparation unless requested in writing by the client.

U = An unpreserved container was received for a method that suggests a preservation in order to extend hold time for analysis.**

- This data package contains sample and QC results for six water samples, requested for the above referenced project on 04/29/26. The samples were received in good condition.
- EPA 300.0, EPA 350.1, EPA 410.4, EPA 6010B, EPA 8270C-SIM, SM 4500-S2-D, SM 5310B, SM2320B, and SM2540C analyses were performed at 931 West Barkley Ave, Orange, CA, 92868.
- EPA 8260B analysis was performed at 2532 E Cerritos Ave., Anaheim, CA, 92806.

Volatile Organics by GC/MS (EPA 8260B):

- Low recoveries were observed for toluene and chlorobenzene in the MS of DW-1 (lab # 558429-001); the BS/BSD were within limits, the associated RPDs were within limits, and these low recoveries were not associated with any reported results. High RPD was observed for 1,1-dichloroethene in the MS/MSD of DW-1 (lab # 558429-001); the RPD was acceptable in the BS/BSD, and this analyte was not detected at or above the RL in the associated samples.
- No other analytical problems were encountered.

Semivolatile Organics by GC/MS SIM (EPA 8270C-SIM):

- 558429-003 was prepared outside of hold time; affected data was qualified with "H".
- No other analytical problems were encountered.

Total Organic Carbon by IR (SM 5310B):
No analytical problems were encountered.

Metals (EPA 6010B):
No analytical problems were encountered.

Ion Chromatography (EPA 300.0):

- Responses exceeding the instrument's linear range were observed for chloride in the MS/MSD for batch 402247; affected data was qualified with "E".
- No other analytical problems were encountered.

Chemical Oxygen Demand by EPA 410.4 (EPA 410.4):
No analytical problems were encountered.

[1] MDL is the minimum measured concentration of a substance that can be reported with 99% confidence that the measured concentration is distinguishable from method blank results. Definition and Procedure for the Determination of the Method Detection Limit, Revision 2, 40CFR, Part 136, Appendix B, EPA 821-R-16-006, December 2016. Values are based upon our default extraction volume/amount and are subject to change.

[2] RL is the lowest level that can be reliably determined within specified limits of precision and accuracy during routine laboratory operating conditions. (The RL cannot be lower than the lowest calibration standard used in the initial calibration of the instrument and must be greater than the MDL.) Values are based upon our default extraction volume/amount and are subject to change.

- ISM prep requires 5 to 10 days to complete; therefore, all TATs begin after the extraction is completed (i.e., One-day TAT yields results in 6 to 11 days from sample submission). Due date listed on WO summary will not accurately reflect the time needed for sample preparation.

- Organic extracts are held for 40 days before disposal; Inorganic extract are held for 30 days.

- MAI assumes that all material present in the provided sampling container is considered part of the sample - MAI does not exclude any material from the sample prior to sample preparation unless requested in writing by the client.

U = An unpreserved container was received for a method that suggests a preservation in order to extend hold time for analysis.**

[1] MDL is the minimum measured concentration of a substance that can be reported with 99% confidence that the measured concentration is distinguishable from method blank results. Definition and Procedure for the Determination of the Method Detection Limit, Revision 2, 40CFR, Part 136, Appendix B, EPA 821-R-16-006, December 2016. Values are based upon our default extraction volume/amount and are subject to change.

[2] RL is the lowest level that can be reliably determined within specified limits of precision and accuracy during routine laboratory operating conditions. (The RL cannot be lower than the lowest calibration standard used in the initial calibration of the instrument and must be greater than the MDL.) Values are based upon our default extraction volume/amount and are subject to change.

NOTES: * STLC and TCLP extractions require 2 days to complete; therefore, all TATs begin after the extraction is completed (i.e., One-day TAT yields results in 3 days from sample submission).

- ISM prep requires 5 to 10 days to complete; therefore, all TATs begin after the extraction is completed (i.e., One-day TAT yields results in 6 to 11 days from sample submission). Due date listed on WO summary will not accurately reflect the time needed for sample preparation.

- Organic extracts are held for 40 days before disposal; Inorganic extract are held for 30 days.

- MAI assumes that all material present in the provided sampling container is considered part of the sample - MAI does not exclude any material from the sample prior to sample preparation unless requested in writing by the client.

U = An unpreserved container was received for a method that suggests a preservation in order to extend hold time for analysis.**

[1] MDL is the minimum measured concentration of a substance that can be reported with 99% confidence that the measured concentration is distinguishable from method blank results. Definition and Procedure for the Determination of the Method Detection Limit, Revision 2, 40CFR, Part 136, Appendix B, EPA 821-R-16-006, December 2016. Values are based upon our default extraction volume/amount and are subject to change.

[2] RL is the lowest level that can be reliably determined within specified limits of precision and accuracy during routine laboratory operating conditions. (The RL cannot be lower than the lowest calibration standard used in the initial calibration of the instrument and must be greater than the MDL.) Values are based upon our default extraction volume/amount and are subject to change.

NOTES: * STLC and TCLP extractions require 2 days to complete; therefore, all TATs begin after the extraction is completed (i.e., One-day TAT yields results in 3 days from sample submission).

- ISM prep requires 5 to 10 days to complete; therefore, all TATs begin after the extraction is completed (i.e., One-day TAT yields results in 6 to 11 days from sample submission). Due date listed on WO summary will not accurately reflect the time needed for sample preparation.

- Organic extracts are held for 40 days before disposal; Inorganic extract are held for 30 days.

- MAI assumes that all material present in the provided sampling container is considered part of the sample - MAI does not exclude any material from the sample prior to sample preparation unless requested in writing by the client.

U = An unpreserved container was received for a method that suggests a preservation in order to extend hold time for analysis.**

- No other analytical problems were encountered.

Metals (EPA 6010B and EPA 7470A):

No analytical problems were encountered.

Ion Chromatography (EPA 300.0):

- High recoveries were observed for nitrogen, nitrate in the MS/MSD for batch 392705; the parent sample was not a project sample, the LCS was within limits, and the associated RPD was within limits.
- No other analytical problems were encountered.

pH of Aqueous Samples (SM 4500-H+ B):

- This data package contains sample and QC results for one water sample, requested for the above referenced project on 04/22/26. The sample was received in good condition.
- EPA 300.0, EPA 6010B, EPA 7470A, and SM 4500-H+ B analyses were performed at 931 West Barkley Ave, Orange, CA, 92868.
- EPA 8260B analysis was performed at 2532 E Cerritos Ave., Anaheim, CA, 92806.

Volatile Organics by GC/MS (EPA 8260B):
No analytical problems were encountered.

Metals (EPA 6010B and EPA 7470A):

- Low recoveries were observed for mercury in the MS/MSD for batch 401768; the parent sample was not a project sample, the LCS was within limits, and the associated RPD was within limits.
- Zinc was detected between the MDL and the RL in the method blank for batch 401580; this analyte was not detected in the sample at or above the RL.
- No other analytical problems were encountered.

Ion Chromatography (EPA 300.0):
No analytical problems were encountered.

RULE 1150.1 QUARTERLY MONITORING REPORT
October – November - December 2025

INTRODUCTION

On May 5, 2011, a Rule 1150.1 Alternative Compliance Plan (ACP) for Chiquita Canyon Landfill was submitted to the South Coast Air Quality Management District (SCAQMD) in order to request alternatives to the new monitoring and reporting requirements in the amended Rule 1150.1. In March 2018, the Alternate Rule 1150.1 Compliance Plan for Chiquita Canyon Landfill was finalized and approved. In the final compliance plan, the request for Quarterly Integrated Surface Sampling was not approved and Monthly Integrated Surface Sampling was set in place. From March 2018 to the end of September 2019, Quarterly Integrated Surface Sampling continued to be performed. In September 2019, SCAQMD staff questioned whether Chiquita Canyon Landfill staff should be monitored monthly, and starting in October 2019, Monthly Integrated Surface Sampling was performed per the Rule 1150.1 monitoring permit. The ACP monitoring program dated March 8, 2018 includes the following schedule:

- Monthly Instantaneous Surface Monitoring
- Monthly Integrated Surface Sampling
- Quarterly Ambient Air Monitoring
- Monthly Perimeter Gas Probe Monitoring
- Quarterly Perimeter Probe Sampling
- Quarterly Gas Collection System Sampling
- Continuous Wind Speed and Direction Monitoring

Although the ACP only requires quarterly instantaneous surface monitoring and quarterly perimeter gas probe monitoring, Chiquita Canyon Landfill has voluntarily performed the instantaneous surface monitoring and perimeter gas probe monitoring on a monthly basis in order to take a proactive approach to odors, surface emissions, and landfill gas (LFG) migration. This report includes the additional monitoring data, along with the required information and a summary of any rule exceedances, including a discussion of the corrective actions taken.

On February 4, 2023, Chiquita Canyon Landfill submitted an Ex Parte Emergency Variance application to the SCAQMD Hearing Board due to an elevated Total Reduced Sulfur Concentration in the gas system. Chiquita Canyon Landfill was granted an Emergency Variance

on February 8, 2023. An Interim Variance was approved on February 15, 2023, and the Regular Variance was approved on May 3, 2023. On September 6, 2023, a hearing on a Stipulated Order for Abatement (SOFA) was held pursuant to provisions of California Health and Safety Code 40823 and 42451(a) and District Rule 812. The SOFA was modified on January 17, 2024, March 21, 2024, April 24, 2024, August 27, 2024, November 13, 2024, April 16, 2025, June 24, 2025, and December 9, 2025. Sampling and monitoring conditions of the Abatement Order include weekly colorimetric tube tests for hydrogen sulfide and weekly analytical flare samples for SCAQMD Method 307.91 (reduced sulfur compounds). The site still has to follow Rule 431.1 AMP and because concentrations are above the limits, the site has to monitor/sample daily. Integrated surface sampling is performed at least three times per month, no more than once every 7 days; instantaneous surface monitoring is performed at least three times per month, no more than once every 7 days; cover inspections are performed daily. The site will continue investigations underlining reaction and odor impacts.

Landfill grids were revised in the first quarter of the 2000 Rule 1150.1 compliance report. Originally, the surface of the disposal area was divided into 81, 50,000 square foot sections. Effective April 1, 2000, monitoring grids were increased to 159 50,000 square foot sections. The grid increase was due to a submittal by the Chiquita Canyon Landfill to exempt steep areas of the landfill for testing, which was denied by the SCAQMD. In October 2012, the number of grids increased to 224 due to expansion of landfill operations. On February 23, 2024, the number of grids increased to 253, due to expansion of landfill operations with Cell 6. These numbered monitoring grids are indicated on the Rule 1150.1 site monitoring map in Exhibit I. The protocol and quality control procedures were performed according to the SCAQMD Guidelines for implementation of Rule 1150.1. If elevated concentrations were measured, these conditions were promptly mitigated through system adjustments to the wells or through application and compaction of cover soil.

Meteorological conditions are analyzed daily by RES Environmental, Inc. (RES) with assistance from Chiquita Canyon Staff to schedule sampling tasks on the landfill. Wind direction and wind speeds are recorded continuously throughout the year at a location that represents excellent meteorological exposure to the Chiquita Canyon Landfill. RES is responsible for the implementation of the Rule 1150.1 testing program and the Rule 1150.1 monitoring report. The meteorological station is shown in Exhibit I. Two ambient air samplers are displayed in the same exhibit.

MONITORING RESULTS

Instantaneous Surface Monitoring Program

Instantaneous Surface Monitoring (ISM) was performed using procedures and equipment described in the SCAQMD Guidelines for Implementation of Rule 1150.1, consistent with the Chiquita Canyon Landfill compliance plan. Effective July 2020, a portable flame ionization detector (FID) which meets or exceeds all guideline specifications was used to obtain instantaneous measurements of total organic compounds (TOC) concentrations immediately above the surface of 253 numbered grids. While traversing the disposal area, the detector probe was held within three inches of the landfill surface to obtain the readings. A surface inspection was also performed during monitoring to identify potential cracks in the landfill cover.

During the quarterly monitoring period, ISM was conducted across the full site for four (4) events and within the reaction area for five (5) events.

Reaction Area was performed October 9th, 2025, and eighty-eight (88) grids were monitored. There were fifty-one (51) hot spots over 500 ppm and three (3) spots that ranged from 200 ppm - 499 ppm. All hot spots passed initial 10-day recheck on October 17th, 2025.

Ambient Air Sampling Program

The ambient air sampling program was designed in accordance with the Guidelines for Implementation of Rule 1150.1 and the compliance plan requirements issued by the SCAQMD. All procedures and equipment used in the program are consistent with guideline specifications. The revised Chiquita Canyon Landfill compliance plan requires the collection of four (4) 12-hour samples located at the landfill perimeter. These 12-hour samples (two each) are representative of the predominant up slope and down slope wind flow patterns during each 12-hour time periods. These two sampling stations are contained in Exhibit I.

These locations were selected based upon evaluation of current and historic wind monitoring data collected on site. Sampling stations are positioned to provide good meteorological exposure to the predominant up slope flows and anticipated nighttime local air drainage patterns typically encountered at this site.

Ambient air samplers used at the Chiquita Canyon Landfill were constructed, installed, and operated to meet SCAQMD design criteria and performance specifications published in the Rule 1150.1 guidelines. Light-sealed boxes containing individual 10-liter Tedlar sample bags were housed within each sampling station enclosure. The quarterly Ambient Air Monitoring Program was initiated on October 9th, 2025. Samples were collected over a period of 12 consecutive hours, with a start/stop time of approximately 9:00 A.M. to 9:00 P.M. and 9:00 P.M. to 9:00 A.M. the next day. After collection, the air samples were delivered to the AtmAA Laboratory to be analyzed for concentrations of methane, total TGNMOs, and core group compounds. Analyses were performed within 72 hours after sampling was concluded.

The concentrations of Rule 1150.1 core group compounds reported for each ambient air sample are presented in Table 4. A 24-hour wind rose is illustrated in Table 5. The complete analytical reports, hourly wind speed and direction summaries and QA records for the ambient air sampling program will be preserved for reviewing at a minimum of five years at the Chiquita Canyon Landfill.

Four samples were selected (AA-1, AA-2, AA-3, and AA-4) and analyzed for group compounds on October 9th, 2025. Reported methane concentrations in AA-1 was 1.43 ppm_v, AA-2 was 1.37 ppm_v, AA-3 was 2.17 ppm_v, and AA-4 was 1.98 ppm_v.

Landfill Gas Sampling Program

During the fourth quarter (October, November, and December 2025) one Landfill gas sample was taken from the main gas transmission header line entering the Flare on December 18, 2025. Using the direct-pump procedure described in EPA Method 25, the gas sample for the month was collected into a 10-liter Tedlar bag over a continuous 10-minute period. The Landfill gas sample was submitted to the AtmAA Laboratory to be analyzed for methane, total TGNMOs and Rule 1150.1 core group components, as well as fixed gases (oxygen, nitrogen and carbon dioxide). The laboratory results reported that the composite landfill gas sample contained methane at a concentration of 26.15 percent by volume in September 2025. Results of the core group compound analysis for landfill gas are reported in Table 6. QA documentation and analytical reports for this quarterly monitoring event will be preserved for reviewing for five years at the Chiquita Canyon Landfill.

In accordance with Chiquita Canyon Landfill's Rule 431.1 Alternative Monitoring Plan, colorimetric tube samples for H_2S are taken and recorded daily from Flare 1. In addition, gas samples are collected from Flare 1 quarterly and analyzed for H_2S by AtmAA Laboratory. The gas sample for fourth quarter 2025 was collected on December 18th, 2025. The results of the analysis for H_2S are:

- Flare 1: 6.31 ppm_v

The level of H_2S detected on December 18th, 2025 at Flare 1 was 6.31 ppm_v; therefore Tier IV sampling was initiated. Drager Tube monitoring was performed for H_2S on October 22nd, 2025, and the results was 15 ppm_v. Drager Tube monitoring was performed on November 11th, 2025, and the results was 10 ppm_v. Drager Tube monitoring was performed on December 18th, 2025, and the results was 5 ppm_v. Sampling and analysis are currently being performed for H_2S at Flare 1 as required by the sites Rule 431.1 permit.

Due to the SOFA, additional daily Drager Tube and SCAQMD Method 307.91 sampling results were required. These results are included in the monthly SOFA reports submitted to the SCAQMD.

Perimeter Probe Sampling Program

The existing perimeter gas migration monitoring network used for Rule 1150.1 compliance at the Chiquita Canyon Landfill consists of 14 multiple-depth probes located along the perimeter of the landfill, as indicated in the Rule 1150.1 site monitoring map in Exhibit I.

An approved portable gas monitoring instrument was used to measure the concentration of TOC's expressed as ppm_v of methane by volume, within each probe casing. The fourth quarter 2025 probe monitoring events were conducted on October 22nd, November 11th, and December 22nd. Title 27 probe monitoring was completed on November 11th and 12th.

October 22nd, 2025 **(1150.1)** perimeter probe monitoring event produced one (1) probe over 5% methane. GP-13; depth 58 feet showed 11.2% methane, depth 87 feet showed 8.6% methane. **(1150.1)** The 1st 10 day re-monitoring for October was done on October 31st, 2025, for probe number GP-13; depth 58 feet showed 2.2% methane, depth 87 feet showed 5.2% methane. The 2nd 10-Day re-monitoring for the October **(1150.1)** event was done on November 11th, 2025, for probe number GP-13; depth 87 feet showed 5.6% methane.

November 11th, 2025 **(1150.1)** perimeter probe monitoring event produced no probes over 5% methane.

November 11th and 12th, 2025 **(Title 27)** perimeter probe monitoring event produced one (1) probe over 5% methane. GP-15; depth 40 feet showed 8.3% methane and depth 60 feet showed 18.8% methane. The 1st 10-Day re-monitoring for the November 11th and 12th, 2025 **(Title 27)** event was done on November 21st, 2025, for probe number GP-15; depth 40 feet showed 8.4% methane and depth feet 60 showed 19.2% methane. The 2nd 10-Day re-monitoring for the November 11th and 12th, 2025 **(Title 27)** event was done on December 1st, 2025, for probe number GP-15; depth 40 feet showed 8.9% methane and depth 60 feet showed 20.0% methane.

December 22nd, 2025 **(1150.1)** perimeter probe monitoring event produced no probes over 5% methane.

October 23rd, 2025 **(1150.1)** GP-13 probe monitoring produced 113,100 ppm_v methane at 58 feet, and GP-13 probe monitoring produced 87,400 ppm_v methane at 87 feet.

November 12th, 2025 **(Title 27)** GP-15 probe monitoring produced 82,600 ppm_v methane at 40 feet, and GP-15 probe monitoring produced 174,600 ppm_v methane at 60 feet.

The following tables show new wells that were installed as part of the 45-day remediation for the above-mentioned probes during the reporting period. New wells and SVE well are planned for further installation and will be reported in the next quarterly report.

Permanent gases were measured by thermal conductivity detection/gas chromatography (TCD/GC), ASTM D1946. The accuracy of permanent gas analysis by TCD/GC is +/- 2%. Actual results are reported. The reported oxygen concentration includes any argon present in the sample. Calibration is based on a standard atmosphere containing 20.95% oxygen and 0.93% argon. Results are reported on a "wet" basis. Ethane and total gaseous non-methane organics (TGNMO) were measured by flame ionization detection/ total combustion analysis (FID/TCA) Method 25. Concentrations are reported as ppmvC. Toxic air contaminants (TAC) compounds were analyzed by GC/MS, EPA TO-15. Hydrogen sulfide was analyzed by SCD/GC, SCAQMD 307.91.

RULE 1150.1 QUARTERLY MONITORING REPORT
January – February – March 2026

INTRODUCTION

On May 5, 2011, a Rule 1150.1 Alternative Compliance Plan (ACP) for Chiquita Canyon Landfill was submitted to the South Coast Air Quality Management District (SCAQMD) in order to request alternatives to the new monitoring and reporting requirements in the amended Rule 1150.1. In March 2018 the Alternate Rule 1150.1 Compliance Plan for Chiquita Canyon Landfill was finalized and approved. In the final compliance plan, the request for Quarterly Integrated Surface Sampling was not approved and Monthly Integrated Surface Sampling was set in place. From March 2018 to the end of September 2019, Quarterly Integrated Surface Sampling continued to be performed. In September 2019, SCAQMD staff questioned whether Chiquita Canyon Landfill staff should be monitored monthly, and starting in October 2019, Monthly Integrated Surface Sampling was performed per the Rule 1150.1 monitoring permit. The ACP monitoring program dated March 8, 2018 includes the following schedule:

- Monthly Instantaneous Surface Monitoring
- Monthly Integrated Surface Sampling
- Quarterly Ambient Air Monitoring
- Monthly Perimeter Gas Probe Monitoring
- Quarterly Perimeter Probe Sampling
- Quarterly Gas Collection System Sampling
- Continuous Wind Speed and Direction Monitoring

Although the ACP only requires quarterly instantaneous surface monitoring and quarterly perimeter gas probe monitoring, Chiquita Canyon Landfill has voluntarily performed the instantaneous surface monitoring and perimeter gas probe monitoring on a monthly basis in order to take a proactive approach to odors, surface emissions, and landfill gas (LFG) migration. This report includes the additional monitoring data, along with the required information and a summary of any rule exceedances, including a discussion of the corrective actions taken.

On February 4, 2023, Chiquita Canyon Landfill submitted an Ex Parte Emergency Variance application to the SCAQMD Hearing Board due to an elevated Total Reduced Sulfur Concentration in the gas system. Chiquita Canyon Landfill was granted an Emergency Variance on February 8, 2023. An Interim Variance was approved on February 15, 2023, and the Regular

Variance was approved on May 3, 2023. On September 6, 2023, a hearing on a Stipulated Order for Abatement (SOFA) was held pursuant to provisions of California Health and Safety Code 40823 and 42451(a) and District Rule 812. The SOFA was modified on January 17, 2024, March 21, 2024, April 24, 2024, August 27, 2024, November 13, 2024, April 16, 2025, and June 24, 2025. Sampling and monitoring conditions of the Abatement Order include weekly colorimetric tube tests for hydrogen sulfide and weekly analytical flare samples for SCAQMD Method 307.91 (reduced sulfur compounds). The site still has to follow Rule 431.1 AMP and because concentrations are above the limits, the site has to monitor/sample daily. Integrated surface sampling is performed at least three times per month, no more than once every 7 days; instantaneous surface monitoring is performed at least three times per month, no more than once every 7 days; cover inspections are performed daily. The site will continue investigations underlining reaction and odor impacts.

Landfill grids were revised in the first quarter of the 2000 Rule 1150.1 compliance report. Originally, the surface of the disposal area was divided into 81, 50,000 square foot sections. Effective April 1, 2000, monitoring grids were increased to 159 50,000 square foot sections. The grid increase was due to a submittal by the Chiquita Canyon Landfill to exempt steep areas of the landfill for testing, which was denied by the SCAQMD. In October 2012, the number of grids increased to 224 due to expansion of landfill operations. On February 23, 2024, the number of grids increased to 253, due to expansion of landfill operations with Cell 6. These numbered monitoring grids are indicated on the Rule 1150.1 site monitoring map in Exhibit I. The protocol and quality control procedures were performed according to the SCAQMD Guidelines for implementation of Rule 1150.1. If elevated concentrations were measured, these conditions were promptly mitigated through system adjustments to the wells or through application and compaction of cover soil.

Meteorological conditions are analyzed daily by RES Environmental, Inc. (RES) with assistance from Chiquita Canyon Staff to schedule sampling tasks on the landfill. Wind direction and wind speeds are recorded continuously throughout the year at a location that represents excellent meteorological exposure to the Chiquita Canyon Landfill. RES is responsible for the implementation of the Rule 1150.1 testing program and the Rule 1150.1 monitoring report. The meteorological station is shown in Exhibit I. Two ambient air samplers are displayed in the same exhibit.

MONITORING RESULTS

Instantaneous Surface Monitoring Program

Instantaneous Surface Monitoring (ISM) was performed using procedures and equipment described in the SCAQMD Guidelines for Implementation of Rule 1150.1, consistent with the Chiquita Canyon Landfill compliance plan. Effective July 2020, a portable flame ionization detector (FID) which meets or exceeds all guideline specifications was used to obtain instantaneous measurements of total organic compounds (TOC) concentrations immediately above the surface of 253 numbered grids. While traversing the disposal area, the detector probe was held within three inches of the landfill surface to obtain the readings. A surface inspection was also performed during monitoring to identify potential cracks in the landfill cover.

During the quarterly monitoring period, ISM was conducted across the full site for four (4) events and within the reaction area for five (5) events.

Reaction Area was performed January 7th and 8th, 2026, and eighty-four (84) grids were monitored. Four (4) grids were not monitored due to active construction. There were twenty-four (24) hot spots over 500 ppm and four (4) spots that ranged from 200 ppm - 499 ppm. All hot spots passed initial 10-day recheck on January 14th, 2026.

Reaction Area was performed on January 15th and 16th, 2026, and eighty-four (84) grids were monitored. Four (4) grids were not monitored due to active construction. There were six (6) hot spots over 500 ppm and one (1) spot that ranged from 200 ppm- 499 ppm. All hot spots passed the initial 10-day recheck on January 26th, 2026.

Full site sweep was performed on January 26th, 27th, and 28th, 2026, and two hundred and forty-four (244) grids were monitored. Nine (9) grids were not monitored due to active construction. There were fifty-eight (58) hot spots over 500 ppm and eight (8) spots that ranged from 200 ppm – 499 ppm. All hot spots passed the initial 10-day recheck on February 4th, 2026.

Full site sweep was performed on February 2nd, 3rd, and 4th, 2026, and two hundred and forty-two (242) grids were monitored. Eleven (11) grids were not monitored due to active construction. There were forty-seven (47) hot spots over 500 ppm and eight (8) hot spots that ranged from 200 ppm - 499 ppm. All hot spots passed the initial 10-day recheck on February 12th, 2026.

Reaction Area was performed on February 10th and 13th, 2026, and eighty-four (84) grids were monitored. Four (4) grids were not monitored due to active construction. There were

forty-three (43) hot spots over 500 ppm and three (3) hot spots that ranged from 200 ppm - 499 ppm. All hot spots passed the initial 10-day recheck on February 20th, 2026.

Full site sweep was performed on February 20th and 21st, 2026, and two hundred and forty-two (242) grids were monitored. Eleven (11) grids were not monitored due to active construction. There were eleven (11) hot spots over 500 ppm and four (4) spots that ranged from 200 ppm - 400 ppm. All hot spots passed the initial 10-day recheck on February 27th, 2026.

Full site sweep was performed on March 10th and 11th, 2026, and two hundred and forty (240) grids were monitored. Thirteen (13) grids were not monitored due to active construction. There were seventeen (17) hot spots over 500 ppm and four (4) spot that ranged from 200 ppm - 499 ppm. All hot spots passed the initial 10-day recheck on March 19th, 2026.

Reaction Area was performed on March 17th and 19th, 2026, and eighty-four (84) grids were monitored. Four (4) grids were not monitored due to active construction. There were twenty-three (23) hot spots over 500 ppm and three (3) spot that ranged from 200 ppm - 499 ppm. All hot spots passed the initial 10-day recheck on March 27th, 2026.

Reaction Area was performed on March 23rd, 2026, and eighty-four (84) grids were monitored. Four (4) grids were not monitored due to active construction. There were thirty-two (32) hot spots over 500 ppm and one (1) that ranged from 200 ppm - 499 ppm. Thirty-one (31) spots passed the initial 10-day recheck on April 2nd, 2026. Two (2) spots didn't pass 10-day recheck on April 2nd, 2026, but passed the 2nd 10-day recheck on April 9th, 2026.

The ISM conducted during the quarter showed two hundred and sixty-one (261) spots over 500 ppm, measured as methane. Eighty-eight (88) spots were detected in January 2026, one hundred and one (101) spots were detected in February 2026, and seventy-two (72) spots were detected in March 2026; these spots were re-monitored and cleared within the first or second 10-day period as allowed by the Rule 1150.1 guideline. There were fifty-five (55) grids that were not monitored due to active construction. A table has been added showing the original inspection date, re-monitoring date, and remediation method(s) for all grids over 500 ppm.

The ISM conducted during the quarter showed thirty-six (36) spots that ranged from 200 ppm - 499 ppm, measured as methane. Ambient Air Sampling Program

The ambient air sampling program was designed in accordance with the Guidelines for Implementation of Rule 1150.1 and the compliance plan requirements issued by the SCAQMD. All procedures and equipment used in the program are consistent with guideline specifications. The revised Chiquita Canyon Landfill compliance plan requires the collection of four (4) 12-hour samples located at the landfill perimeter. These 12-hour samples (two each) are representative of the predominant up slope and down slope wind flow patterns during each 12-hour time periods. These two sampling stations are contained in Exhibit I.

These locations were selected based upon evaluation of current and historic wind monitoring data collected on site. Sampling stations are positioned to provide good meteorological exposure to the predominant up slope flows and anticipated nighttime local air drainage patterns typically encountered at this site.

Ambient air samplers used at the Chiquita Canyon Landfill were constructed, installed, and operated to meet SCAQMD design criteria and performance specifications published in the Rule 1150.1 guidelines. Light-sealed boxes containing individual 10-liter Tedlar sample bags were housed within each sampling station enclosure. The quarterly Ambient Air Monitoring Program was initiated on February 25th, 2026. Samples were collected over a period of 12 consecutive hours, with a start/stop time of approximately 9:00 A.M. to 9:00 P.M. and 9:00 P.M. to 9:00 A.M. the next day. After collection, the air samples were delivered to the AtmAA Laboratory to be analyzed for concentrations of methane, total TGNMOs, and core group compounds. Analyses were performed within 72 hours after sampling was concluded.

The concentrations of Rule 1150.1 core group compounds reported for each ambient air sample are presented in Table 4. A 24-hour wind rose is illustrated in Table 5. The complete analytical reports, hourly wind speed and direction summaries and QA records for the ambient air sampling program will be preserved for reviewing at a minimum of five years at the Chiquita Canyon Landfill.

> Four samples were selected (AA-1, AA-2, AA-3, and AA-4) and analyzed for group compounds on February 25th and 26th, 2026. Reported methane concentrations in AA-1 was 1.90 ppm_v, AA-2 was 2.45 ppm_v ,AA-3 was 4.62 ppm_v, and AA-4 was 1.71 ppm_v.

Landfill Gas Sampling Program

During the first quarter (January, February, March 2026) one Landfill gas sample was taken from the main gas transmission header line entering the Flare on March 24th, 2026. Using the direct-pump procedure described in EPA Method 25, the gas sample for the month was collected into a 10-liter Tedlar bag over a continuous 10-minute period. The Landfill gas sample was submitted to the AtmAA Laboratory to be analyzed for methane, total TGNMOs and Rule 1150.1 core group components, as well as fixed gases (oxygen, nitrogen and carbon dioxide). The laboratory results reported that the composite landfill gas sample contained methane at a concentration of 33.49 percent by volume in March 2026. Results of the core group compound analysis for landfill gas are reported in Table 6. QA documentation and analytical reports for this quarterly monitoring event will be preserved for reviewing for five years at the Chiquita Canyon Landfill.

Rule 431.1 Sampling and Results

In accordance with Chiquita Canyon Landfill's Rule 431.1 Alternative Monitoring Plan, colorimetric tube samples for H_2S are taken and recorded daily from Flare 1. In addition, gas samples are collected from Flare 1 quarterly and analyzed for H_2S by AtmAA Laboratory. The gas sample for first quarter of 2026 was collected on March 24th, 2026. The results of the analysis for H_2S are:

- Flare 1: 33.49 ppm_v

The level of H_2S detected on March 24th, 2026 at Flare 1 was 147 ppm_v; therefore Tier IV sampling was initiated. Drager Tube monitoring was performed for H_2S on January 28th, 2026, and the results was 10 ppm_v. Drager Tube monitoring was performed on February 23rd, 2026, and the results was 10 ppm_v. Drager Tube monitoring was performed on March 24th, 2026, and the results was 15 ppm_v. Sampling and analysis are currently being performed for H_2S at Flare 1 as required by the sites Rule 431.1 permit.

*Permanent gases were measured by thermal conductivity detection/gas chromatography (TCD/GC) ASTM D1946. The accuracy of permanent gas analysis by TCD/GC is +/- 2%. Actual results are reported. The reported oxygen concentration includes any argon present in the sample. Calibration is based on a standard atmosphere containing 20.95% oxygen and 0.93% argon. Results are reported on a "wet" basis. Ethane and total gaseous non-methane organics (TGNMO) were measured by flame ionization detection/ total combustion analysis (FID/TCA) Method 25. Concentrations are reported as ppmvC. Toxic air contaminants (TAC) compounds were analyzed by GC/MS, EPA TO-15. Hydrogen sulfide was analyzed by SCD/GC, SCAQMD 307.91. * total amount containing meta, para, and ortho isomers.*

[1] MDL is the minimum measured concentration of a substance that can be reported with 99% confidence that the measured concentration is distinguishable from method blank results. Definition and Procedure for the Determination of the Method Detection Limit, Revision 2, 40CFR, Part 136, Appendix B, EPA 821-R-16-006, December 2016. Values are based upon our default extraction volume/amount and are subject to change.

[2] RL is the lowest level that can be reliably determined within specified limits of precision and accuracy during routine laboratory operating conditions. (The RL cannot be lower than the lowest calibration standard used in the initial calibration of the instrument and must be greater than the MDL.) Values are based upon our default extraction volume/amount and are subject to change.

- ISM prep requires 5 to 10 days to complete; therefore, all TATs begin after the extraction is completed (i.e., One-day TAT yields results in 6 to 11 days from sample submission). Due date listed on WO summary will not accurately reflect the time needed for sample preparation.

- Organic extracts are held for 40 days before disposal; Inorganic extract are held for 30 days.

- MAI assumes that all material present in the provided sampling container is considered part of the sample - MAI does not exclude any material from the sample prior to sample preparation unless requested in writing by the client.

U = An unpreserved container was received for a method that suggests a preservation in order to extend hold time for analysis.**
