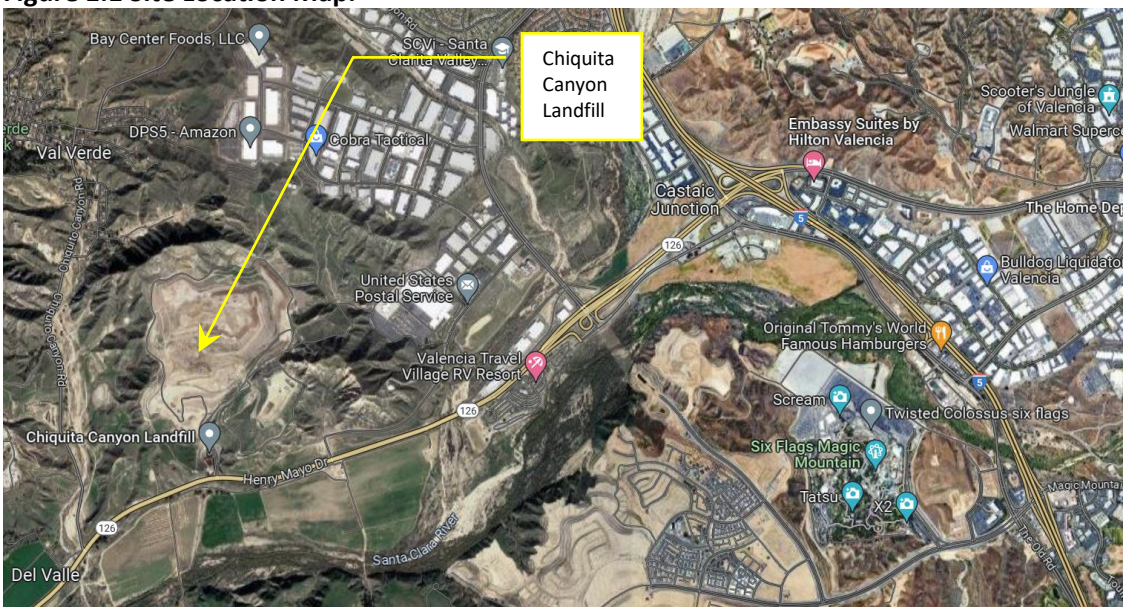
1. Introduction

Background

The Chiquita Canyon Landfill (CCLF or Landfill) is a municipal solid waste (MSW) landfill located in northern Los Angeles County. An area of the Landfill has experienced elevated gas temperatures and surface subsidence, with accompanying elevated gas generation, due to a subsurface reaction. This report is intended to provide an air emissions assessment (Test Event #8) to determine landfill surface air emissions for both the area of the Landfill affected by the reaction and areas not affected by the reaction. The prior test events at the Landfill were conducted on:



1. August 29-31, 2023
2. March 19-21, 2024
3. November 19-21, 2024
4. March 19-21, 2025
5. July 15-23, 2025
6. November 10-25, 2025
7. March 16-20, 2026

The Eighth Test Event, which is described in this report, was conducted on July 20-24, 2026.

Site Location

The test site is Chiquita Canyon Landfill, which is located at 29201 Henry Mayo Drive, Castaic, California, 91384.

Figure 1.1 Site Location Map.

Facility Description

Since the time of the Fourth Test Event, Chiquita Canyon Landfill has been an inactive MSW disposal facility and has not been receiving waste.

Objective

The objective of this emissions assessment was to quantify, by field measurement, the air emissions of fixed gases (including methane, carbon dioxide, and carbon monoxide), reduced sulfur compounds, and speciated volatile organic compounds (VOCs) from the area of the Landfill affected by the reaction and areas not affected by the reaction.

Methodology

The Landfill's air emissions were directly measured using the U.S. Environmental Protection Agency (USEPA) Surface Emission Isolation Flux Chamber (flux chamber) following the USEPA User's Guidance document (see Photo 1.1). Whole air samples were collected from the flux chamber using Summa® canisters and Tedlar® bags with analysis by the following methods:

- ASTM D-1945/USEPA Method 3C for fixed gases (including methane, carbon dioxide, and carbon monoxide);
- USEPA Method TO-15 (MS) for 1-1-Difluoroethane (1,1-DFA, trace gas added for advective flow determination);
- South Coast Air Quality Management District (SCAQMD) Method 307-91 for hydrogen sulfide (H_2S)/organic reduced sulfur (ORS);
- USEPA Method TO-14 (GC/FID) for speciated VOCs;
- USEPA Method TO-15 (GC/MS) for speciated VOCs (including tentatively identified compounds); and
- USEPA Method TO-12 for total VOC (total non-methane hydrocarbon (TNMHC)) with functional group/molecular weight distribution.

Flux from soil surfaces can either be diffusive (driven by molecular action), advective (driven by gas movement), or a combination of both. Given that it was expected that the landfill surface would have an advective flow at some or many locations, the flux chamber assessment included the use of a tracer (1-1-Difluoroethane (1,1-DFA), analyzed per USEPA Method TO-15) in the chamber sweep air gas as per

Photo 1.1 USEPA Flux Chamber Used in Testing Program.

SCAQMD Rule 1133.3, Attachment A. The dilution of the tracer taken from the evacuated canister

samples was used to calculate total flow in the flux chamber for the emissions assessment. Note that TO-12, TO-14, TO-15, USEPA Method 3C, and USEPA Method 3C samples were collected and analyzed from the same sample canister.

Landfill Surface Nomenclature

For the purposes of this test, the Landfill surface was divided into the following areas:

Non-Reaction Area

This is the portion of the Landfill that is not affected by the landfill reaction and that did not exceed the SCAQMD Rule 1150.1 integrated data limit of 25 parts per million by volume (ppmv) on July 6, 2026, the dates of the site-wide SEM event whose data was used to select the test cells.

Membrane Area

This includes the reaction area, the portion of the Landfill designated as being affected by the landfill reaction as defined by SCS Engineers' (SCS) staff in accordance with procedures established by the Reaction Committee, and that did not exceed the SCAQMD Rule 1150.1 integrated data limit on July 6, 2026 (See Appendix 1 for the delineation of the Reaction Area used for this report. This delineation map was provided by SCS engineers November 2025); as well as some of the adjacent non-reaction area, that is covered with a HDPE membrane (see Photo 1.2).

Photo 1.2 Flux Chamber on Membrane Covering Portion of Landfill.

Membrane/Soil Cover Interface Area

These are the SEM Grid Cells that have partial soil cover and partial HDPE membrane cover.

Exceedance Area

This is the portion of the Landfill that was designated as being affected by the landfill reaction and that exceeded the SCAQMD Rule 1150.1 integrated data limit on July 6, 2026. This portion of the Landfill was considered separately to assess any impact of the grid cells that exceeded the Rule 1150.1 integrated data criteria would have on total site surface emissions. Note that these grid cells are subject to a strict remediation schedule, so elevated emissions from these cells would be a temporary phenomenon. Note also that for this test event, there was no SEM exceedance for any cell. Therefore, for this test event the 'exceedance' cells were potentially high emission cells based on drone data.

Anomalous Cell Area

This is the portion of the Landfill where conditions existed at the time of testing which were expected to result in increased flux rates. Three grid cells were targeted because they had site data (other than the SEM data) that suggested air emissions potential. The details of selecting these cells is provided further below in this report as well as in the Test Protocol attached to this report.

Road Surface/Laydown Area

For this test event, a portion of road surface (See Figure 3.3, below), and an equipment laydown area (See Figure 3.4, below), were tested. This test was to only compare road surface/laydown area emissions with membrane surface emissions.

2. Sampling Scope

Each Landfill area was tested using the flux chamber technology. Flux chamber measurement data performed at representative locations within grid cells was used to estimate the following constituents from the Landfill: VOCs, sulfur compound, toxic air contaminant (TACs), and fixed gas emissions.

The completed scope of work for the emissions assessment is given below in Table 2.1.

Table 2.1 Scope of Work for the Air Emissions Assessment.

	Scope	
Source Category	**Source Level**	**Number of Sample Sets**
Non-Reaction Area	High	4
	Med	4
	Low	4
Interface Area	High	4
	Med	4
	Low	4
Membrane Area	High	4
	Med	4
	Low	4
Anomalous Area	High	4
	Med	4
	Low	4
Exceedance Area		4
Road Surface		4
Laydown Area		4
Total Sample Locations		**60**
QA/QC		10
Total Sample Set Count		70

3. Sampling Strategy

Selection of Sampling Locations

Sampling locations were selected based on SEM data obtained under the SCAQMD Rule 1150.1 SEM program. The SEM program consists of surveying the Landfill surface on a track using a field portable, calibrated instrument sensitive to methane and total non-methane hydrocarbon (TNMHC). The landfill grid pattern is shown in Figure 3.1. The grid cells that were sampled are enclosed in a geometric figure.

Test Cell Selection Methodology

This emissions assessment was conducted by analyzing Rule 1150.1 SEM data and categorizing the Landfill areas based on surface emissions. At this site, SEM events are conducted as often as every two weeks.

The SEM events are conducted using an instrument fit with a flame ionization detector (FID) along with global positioning system (GPS) location recording to map fugitive surface hydrocarbon concentrations following a pattern in each grid cell for the site. Instantaneous fugitive concentration data is determined by walking a serpentine path across each nominal 50,000 square foot (ft^2) Landfill grid cell. Integrated concentration data is determined by averaging the instrument readings obtained while traversing the serpentine path as illustrated in Figure 3.2.

Emissions concentration data and location information are collected and stored for the purpose of ranking grid cells on the Landfill by emissions concentration. The integrated concentration data was used to 'rank' the grid cells into categories of high emissions, medium emissions, and low emissions. The instantaneous fugitive concentration data was used to select representative locations for flux chamber testing where flux data for VOCs, sulfur, and toxic air contaminants was collected. The flux from these representative locations was used to estimate air emissions from the entire surface of these cells.

Road Surface/Laydown Area

For this test event, the surface of a road section and a laydown area were tested to determine how the emissions from the road surface/laydown area compared to the Landfill surfaces covered by HDPE membrane. Figure 3.3 shows the portion of the road surface that was tested and Figure 3.4 shows the laydown area. The road surface was screened on the centerline using the same methods and technology used for the landfill SEM screening. The laydown area was screened based on a similar serpentine pattern as the SEM grid cells.

Figure 3.1 Chiquita Canyon Landfill Test Grid Cells.

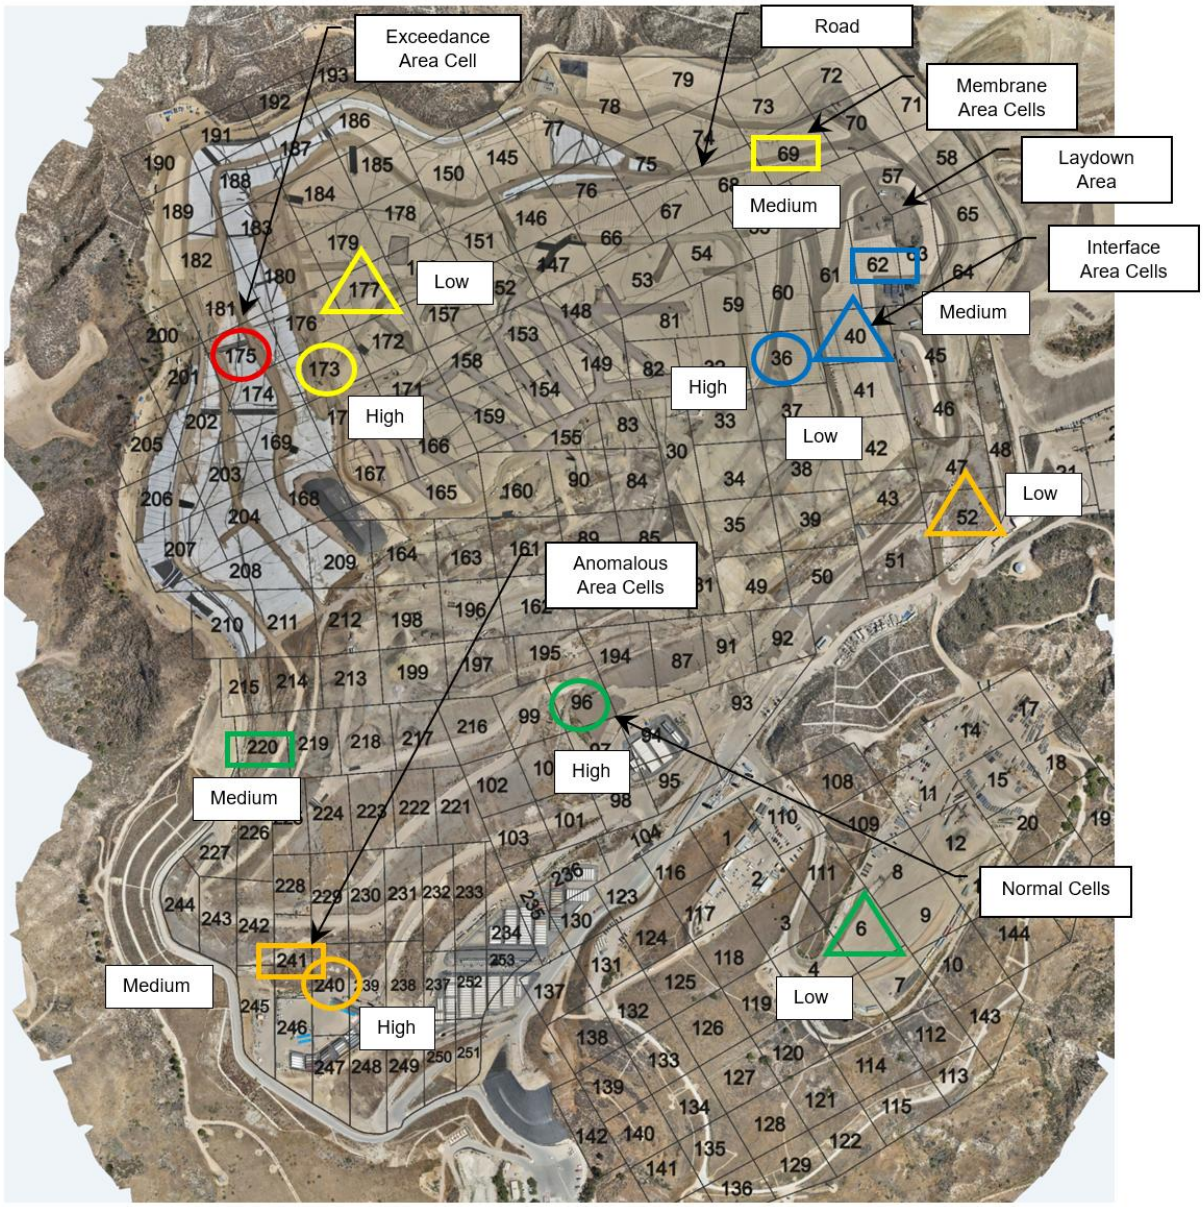


Figure 3.2 Typical Serpentine Landfill Walk Pattern for a 50,000 Square Foot Grid (from Rule 1150.1).

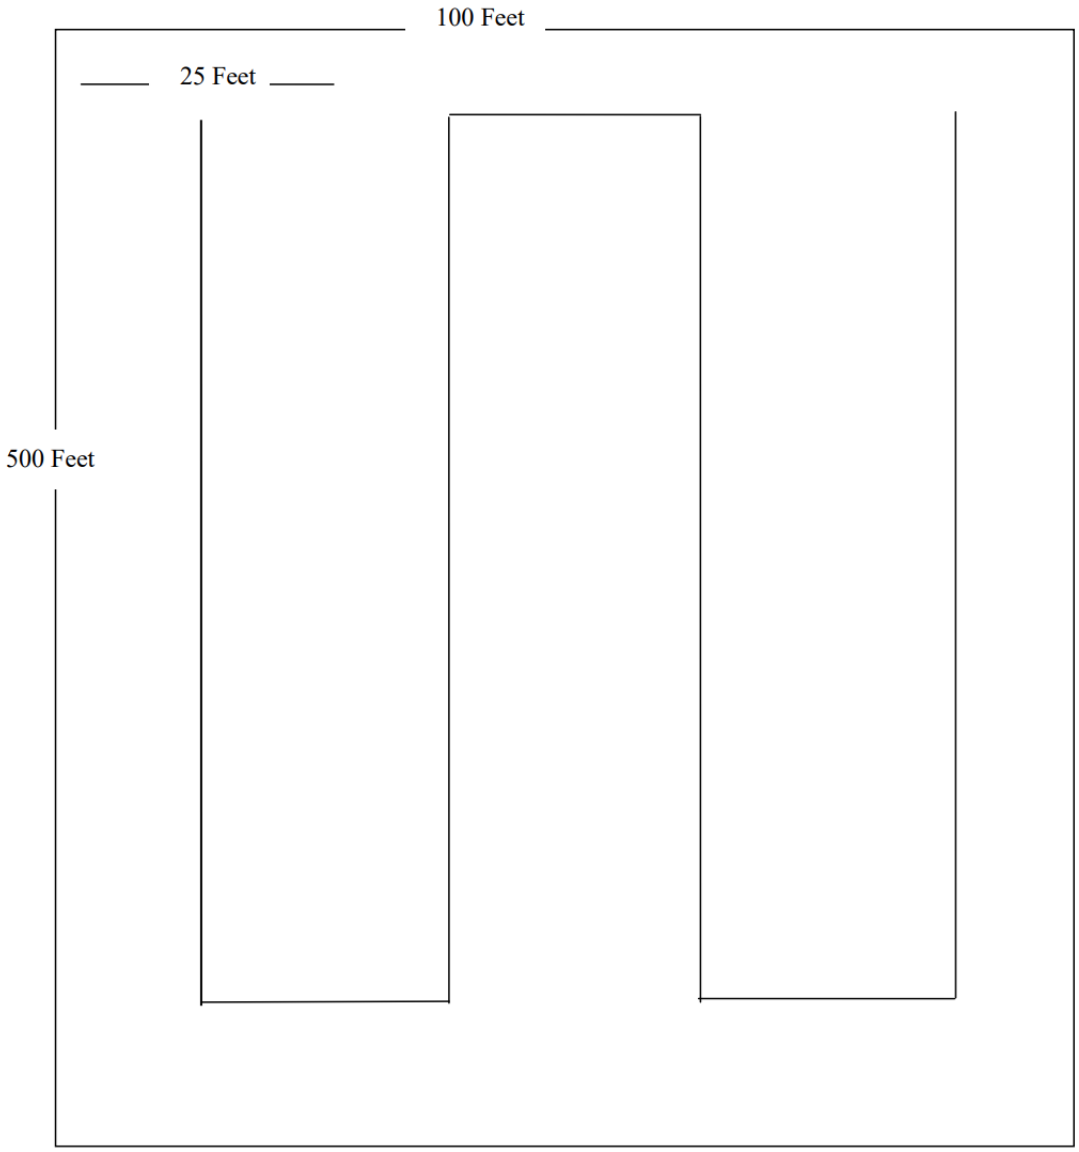

Figure 3.3 Road Section that was tested for Surface Emissions.

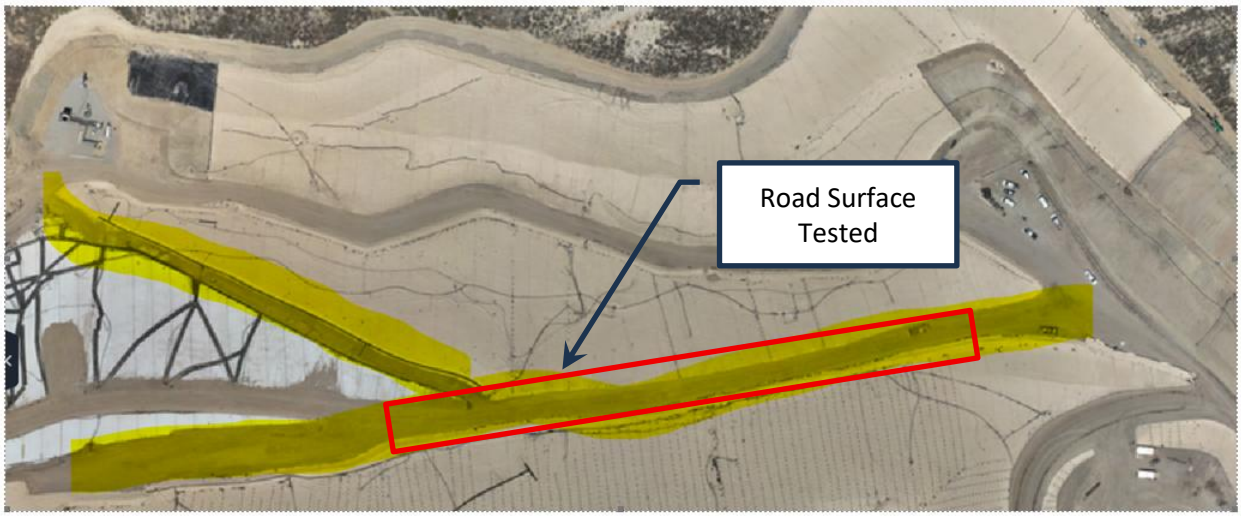

Figure 3.4 Lay Down Area that was tested for Surface Emissions.

Anomalous Cell Selection

Based on a SCAQMD suggestion, additional data, apart from the SEM data, should be used to select "anomalous cells", where conditions exist at the time of testing which are expected to result in increased flux rates. This additional data may include data on:

- Well pressures
- Subsurface temperatures
- Extracted gas character
- Methane data from drone fly-overs
- Other concerns, including construction and/or gas system modifications.

A complete description of the anomalous cell selection criteria and procedures is provided in the Test Protocol attached to this report.

The following cells were selected for this emission source category:

- These cells had ongoing operating issues: 41, 48, 52, 172.
- These cells had new wells proposed: 92, 238, 239, 240, 241, 242, 245, 246, 248.
- These cells had construction activity: 43, 47, 87.

SEM Data Tables

Tables 3.1 through 3.3 show the sorted integrated SEM data for the non-reaction area cells during the period of July 6, 2026. Table 3.4 shows the sorted integrated SEM data for the membrane/soil cover interface area cells during the period of July 6, 2026. Table 3.5 shows the sorted integrated SEM data for the membrane area cells during the period of July 6, 2026. Table 3.6 shows the sorted integrated SEM data for the anomalous area cells during the period of July 6, 2026. Table 3.7 shows the sorted integrated SEM data for the exceedance area (Drone 'exceedance', not SEM exceedance) cells during the period of July 6, 2026. The row of the actual cell tested on each table is highlighted in yellow.

The structure of Tables 3.1 through 3.7 is as follows:

- Column 1: grid cell number designation.
- Column 2: surface area of each grid cell (each grid cell is nominally 50,000 ft^2, but for this analysis, the exact area of each grid cell is used).
- Columns 3: integrated SEM values (FID response as ppmv methane) for the SEM event from July 6, 2026.
- Column 4: cumulative average of all the grid cells above the grid cell in question.
- Column 5: percentage-of-total of grid cells in the grid cell grouping.

Target for the test cells are: 16.7% of the total of grid cells in the grid cell grouping for the high group (this is the midpoint of the top 33% of the emissions that the high group represents), 50% for the medium group, and 83.3% for the low group.

Table 3.1 Summary of Non-Reaction Area Cell Sorted Integrated Grid Data (July 6, 2026) (ppmv FID as methane); High Emission Cells.

Grid	Surface Area (ft2)	Integrated FID Value (7/6)	Cumulative Integrated Value	Fraction of Total

248	42,748	2.23	102.88	100%

Note: The rows of the target cells in this table (Grid Cell ID Numbers 48, 241 and 52) are highlighted in yellow. Cell 240 was tested instead of cell 48 due to access concerns. The 'medium' cells are highlighted in blue.

Table 3.7 Summary of Exceedance Area Cell Sorted Integrated Grid Data (July 6, 2026) (ppmv FID as methane); All Cells.

Grid	Surface Area (ft2)	Integrated FID Value (7/6)	Cumulative Integrated Value	Fraction of Total
33	50,273	19.95	19.95	28%
175	50,430	12.42	32.37	45%
181	49,379	12.42	44.79	63%
174	48,344	11.79	56.58	80%
37	57,548	8.44	65.02	91%
60	58,550	6.14	71.16	100%

Note: There were no SEM exceedance cells for this test event. These cells were selected based on drone data. The row of the actual cell tested in this table (Grid Cell ID Number 175) is highlighted in yellow.

The non-reaction area test cells (see Tables 3.1 through 3.3) were initially selected by organizing the integrated SEM data by average (Column 3) and splitting the resulting data into three categories: high emission, medium emission, and low emission. From there, the mean cell(s) from each group were initially selected for testing. These cells are highlighted in yellow in Tables 3.1 to 3.3 above.

A similar process was used for selecting the test cells in the remaining areas (see Tables 3.4 to 3.7). One grid cell was selected to be tested from the exceedance area. The Landfill was evaluated for the final cell selection each morning of this test event. This final selection process was necessary to verify whether a selected cell was accessible for testing or is otherwise not representative. For example, for this test event, cell 28 was initially selected for testing but later identified as not suitable for testing (due to construction activity in the grid cell) and substituted with cell 6. Note that while any cell can be tested and pro-rated using this methodology, the mean emissions cells were used because they should result in the most accurate results.

Selecting Test Points in a Cell

Using survey flags, the serpentine route prescribed by Rule 1150.1 was walked in a cell and flame ionization detector (FID) readings were periodically noted on the planted flags and field screening data forms provided in Appendix 2.

Flux chamber samples were taken at the following target locations:

1. Highest Emission - Peak FID reading on serpentine walk.
2. High Emission - Mid-point of highest 10% of readings.
3. Medium Emission - Mid-point of the next 40% of readings.
4. Low Emission - Mid-point of lowest one half of readings.

Table 3.8 shows the selected test grid cells along with their area metrics. For most test events, there are cells that are not screened due to operational conflicts and high hazard conditions. For these cells that do not undergo the SEM event their surface area is shown on the “Non SEM Area” line near the bottom of Table 3.8 and summed in the “Non SEM Area” category.

Table 3.8 Selected Test Grid Cell Area Metrics.

		Rep	Area Rep	
Category	**Subset**	**Cell**	**(ft2)**	**(m2)**

4. Sampling Results

All sampling for the Eighth Test Event took place on July 20-24, 2026. Table 4.1 presents the sampling data for the key compounds: methane and VOCs (TNMHC). Complete data with quality assurance/quality control (QA/QC) commentary and calculations are provided in Attachment 1 (**Data Validation Technical Memorandum** (DVTM)). Location 1 represents the low emission grid measurement, location 2 represents the medium emission grid measurement, location 3 represents the medium emission grid measurement, and location 4 represents the highest grid measurement.

Table 4.2 shows the calculated flux for the TO-15 compounds that were detected at least once in the data set. Non-detects were assumed to be MDL/2.

Tables 4.3 and 4.4 show the results for TO-14 and ORS (SCAQMD Method 307-91) respectively. The complete list of all target compounds is provided in the DVTM. Tentatively identified compound (TIC) concentrations are shown in the lab reports provided in Appendix C of Attachment 2.

Table 4.1 Summary of Sampling Results.

Note that 1,1-DFA sample data T-406 was replaced with the average sample data for Grid Cell 40.
Flux = mg/m2-min

Table 4.1 Notes: LOC = Location, H2 = Hydrogen, TNMHC = Total Non-Methane Hydrocarbon, CO2 = Carbon Dioxide, mg/m3 = milligram per cubic meter, mg/min = milligram per minute, m3/min = cubic meter per minute, m/min = meters per minute, , ug/m2, min = microgram per square meter per minute, J = quantified data near detection limit, Media Blank = QA/QC data (see DVTM), Flux = mg/m2-min.

Table 4.2a TO-15 Compounds (Flux in mg/m2-min for only compounds with at least one detect).

Note: Compounds shaded in magenta had no detects for this test event. The value provided for these compounds was derived by assuming that measured concentration was equal to ½ the method detection limit.

5. Data Analysis

Cell Area Apportionment

Table 5.1 shows how the individual flux chamber data points were apportioned to calculate the average flux value for each test grid cell. Four measurements were made in each test cell. The four measurements were targeted to represent the low emission (bottom half), medium emission (between the bottom half and the top 10%), high emission (top 10%), and maximum screened concentration in the test cell. Therefore, the target low measurement represented 50% of the cell area, the medium measurement represented 40% of the cell area, the high measurement represented 10% of the cell area, and the maximum measurement represented the area of the flux chamber, 0.13 m^2. However, the actual values were substantially different than the target values. Table 5.1 shows the calculated apportionment values based on the analysis of interior cell screening. The calculation basis is provided in Appendix 2.

Table 5.1 Grid Cell Area Apportionment by Interior Grid Cell Zone.

		Rep	Sample Apportionment			
Category	**Subset**	**Cell**	**Low**	**Med**	**High**	**Max**

LD Yard		LD Yard	75%	13%	13%	0.003%
Road		Road	25%	25%	25%	25%

The average flux value of the cell was calculated by multiplying the appropriate apportionment factor (see Table 5.1) by the measured flux value for each position. The maximum reading was assumed to be valid only under the flux chamber, an area of 0.13 m^2, because the maximum reading is only represented at one point of the grid. No other portion of the grid is represented by the maximum reading. Note that some of the grid cells had the same or similar screening values throughout the cell, and therefore no identifiable maximum. For those cells, the surface allocation to the "Max" value is greater than the 0.003% value assigned to the cells that did have an identifiable maximum value.

Emissions Calculations

All emissions calculations are provided in Appendix 3. As an example, the methane emissions calculation is provided below in Table 5.2. The flux values shown in Section 5 (for the four internal cell

Table 5.2 Methane Emissions Calculations.

categories (low, medium, high, and max) are averaged based on the area apportionment described above. That average cell flux value (column "W. Avg" (Weighted Average)) is then multiplied by the area represented by that grid cell to arrive at the total emissions. Emissions were calculated and presented using the calculation methodology as stated in the test protocol.

Carbon monoxide and hydrogen were not detected in any of the samples and were not otherwise quantified.

Tentatively identified compounds (TICs) are provided in the lab reports provided in Appendix C of Attachment 2. Since detections of TICs were sparse, emission calculations for site-wide flux were not completed for these chemicals. However, upon request, TIC calculations could be provided.

Emissions Summary

Tables 5.3 and 5.4 summarize the total site surface emissions in tons per year. Although the emissions data is presented in tons per year, it should be noted that these emission rates are only valid for the time-period during the sampling event and are not intended to imply that the emissions over the next 365 days would be equal to these values. All laboratory data that were reported as "not detected" were quantified at one-half the method detection limit (MDL) for the emissions calculations. In addition, the average flux rate for each compound is provided in mg/m2-min for each of the tables.

Data Based Observations

Overall Data Trend

Table 5.5 provides a comparison of site-wide emission rates (in tons/yr) for selected chemicals from the August 2023, March 2024, November 2024, March 2025, July 2025, November 2025, March 2026 and July 2026 flux chamber testing events. These data demonstrate that although there was a significant increase in emissions from the First to the Second Test events, resulting from major upset conditions that occurred during the Second Test Event, the results from the Third, Fourth, Fifth, Sixth, Seventh and Eighth Test Events, showed a substantial decrease in emissions in comparison to those earlier events for most of the speciated compounds analyzed. This trend is likely a result of improvements in gas recovery and cover systems at the Landfill. Note that for most of the speciated compounds, the laboratory results were near or below the method detection limit. Therefore, there will likely be limited further reductions in quantifiable emissions for those compounds in future events due to the limitations of the performance of the chemical analysis for the gas samples.

During the Eighth Test Event, there were lower and even record low emissions for most constituents, including carbon dioxide, methane, total VOCs, and certain individual VOCs than the previous Test Events. Here are the notable highlights for this data set:

1. Trichloroethene (TCE) was the dominant toxic compound in the emissions profile. This compound has had a very inconsistent presence in the previous seven test events. In addition, in landfills, TCE decay products (*e.g.* PCE, vinyl chloride) normally appear alongside this compound and are not appearing in this case. No systematic contamination of TCE was detected and the laboratory has verified its presence and quantity in the samples with a high degree of certainty. Note that even though this is the dominant toxic compound, the flux chamber concentrations are still very low (double digit ppbv). TCE, PCE, and vinyl chloride have not been detected in the landfill gas.
2. Beyond the TCE, oxygenated organic compounds now dominate the mass emissions profile.
3. Carbon dioxide and methane mass emissions reached a record low value.
4. Total VOC emissions were the second lowest for all test events.
5. Sulfur compounds are near record lows across the board.
6. Benzene emissions were the second lowest for all test events.

Table 5.5 Comparison of Site-wide Surface Air Emissions (tons/yr) for the Eight Test Events.

Method Detection Limit Calculation Assumptions

All officially reported emissions are calculated based on using one half of the method detection limit (MDL) for the concentration when a compound is not detected (ND = MDL/2). Table 5.6 shows the impact of this assumption by comparing the ½ MDL data to a calculation where a "Not Detected" compound is assumed to be a zero value (ND = 0). The emissions of the blue highlighted compounds are the most impacted by this assumption.

Table 5.6 Comparison of Method Detection Limit Calculation Assumptions (Compounds most impacted are shaded).

Compound	ND=MDL/2	ND=0	%ND
Carbon Dioxide	12,697	9,517	25%
Methane	163	159	2%
VOC	3.9	3.9	2%

Methyl Mercaptan	0.1518	0.0000	100%

Membrane Emissions

Table 5.7 shows the membrane emissions as compared to the total emissions. The compounds with the high percent membrane emissions may be permeable through the membrane. However, note that for many of these compounds, as shown above, are dominated by non-detects, which means that the reported mass emissions of these constituents are dominated by the assumption that a non-detect is equal in value to one-half the detection limit. This level of Non-Detections for Total Emissions to Membrane Emissions further demonstrates the effectiveness of Chiquita's mitigation measures in improving emissions. Therefore, caution is urged concerning drawing conclusions for those compounds.

Table 5.7 Comparison of Total Emissions to Membrane Emissions.

		Emissions		
Compound	**Units**	**Total**	**Membrane**	**%Membrane**

Membrane Interface Performance

There has been concern that the membrane/soil cover interface may have higher emissions. Past events have shown this not to be the case. However, for this event, there was a significant increase in emissions in the interface zone as compared against the membrane area, with methane being the most significant by a large margin. Table 5.8 shows the percentage increase in interface area flux as compared to the membrane flux for identified compounds. The compounds with the most significant increases in the interface are highlighted in blue. Note that for this test event, the total site methane emissions were the lowest of the eight test events.

Table 5.8 Comparison of Flux from the Membrane, and Membrane/Soil Cover Interface.

Compound	Units	Membrane Area	Interface Area	% Increase for Interface
Carbon Dioxide	mg/m2-min	13	21	68%
Methane	mg/m2-min	0.0178	1.4952	8284%

Air Emissions Distribution by Source Category

The emissions are computed by category, with the five categories being:

1. Exceedance Area
2. Membrane Area
3. Interface Area
4. Anomalous Area
5. Non-reaction Area

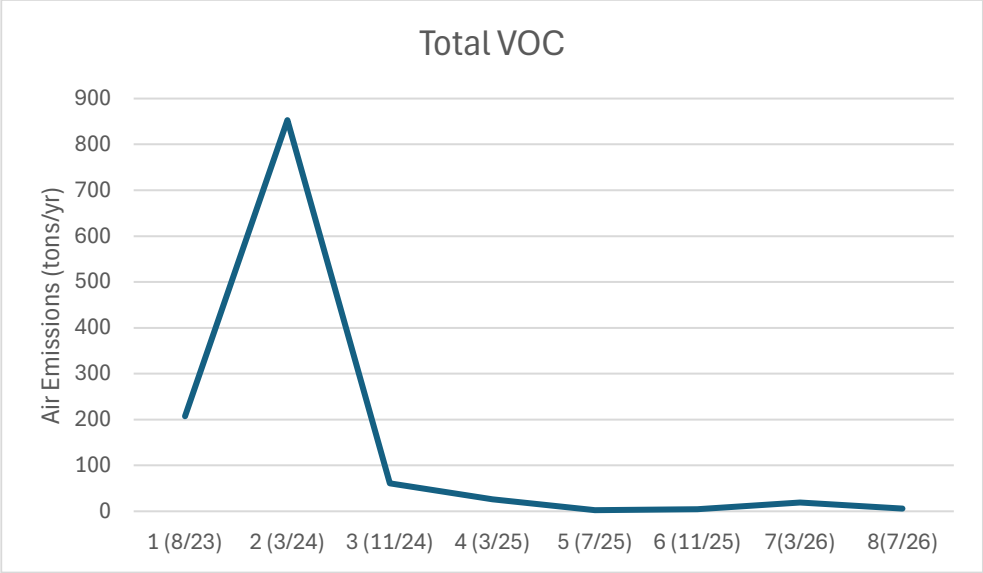
Figure 5.1 shows distribution of emissions for the top speciated TO-15 compounds. This graph shows that emissions for methanol, acetone, and trichloroethene are largely attributable to the emissions from the non-reaction/non-exceedance areas. All other compounds are largely attributable to emissions from the membrane/exceedance landfill areas.

Figure 5.1 Air Emissions Distribution by Source Category.

Trend Analysis of Individual Compounds and Compound Groups

Figure 5.2 shows the trend for total VOC by TO-12 as C1. It is gradually bottoming out after the steep decline between the Second and Third Test Events.

Figure 5.2 Total VOC for all Sampling Events.



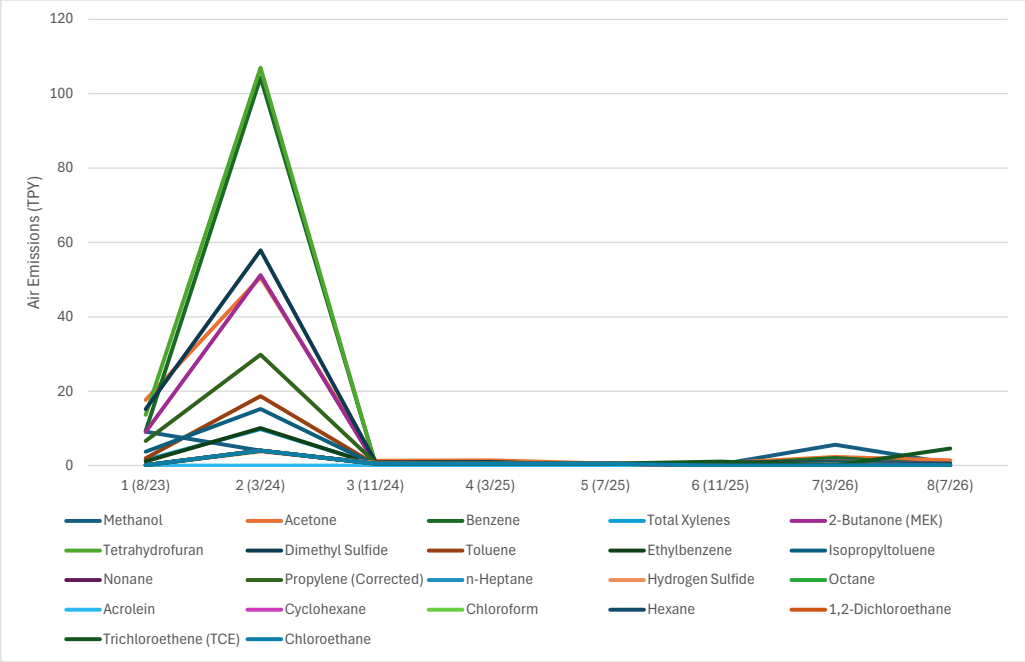


Figure 5.3 shows the trend for speciated toxic compounds. This figure shows that the toxic emissions are holding steady at a fairly low level between the Third and Eighth Test Events. The future toxic emissions will likely not deviate from these low levels found during the Third, Fourth, Fifth, Sixth, Seventh, and Eighth Test Events.

Figure 5.3 Speciated Toxic Compounds for all Sampling Events.

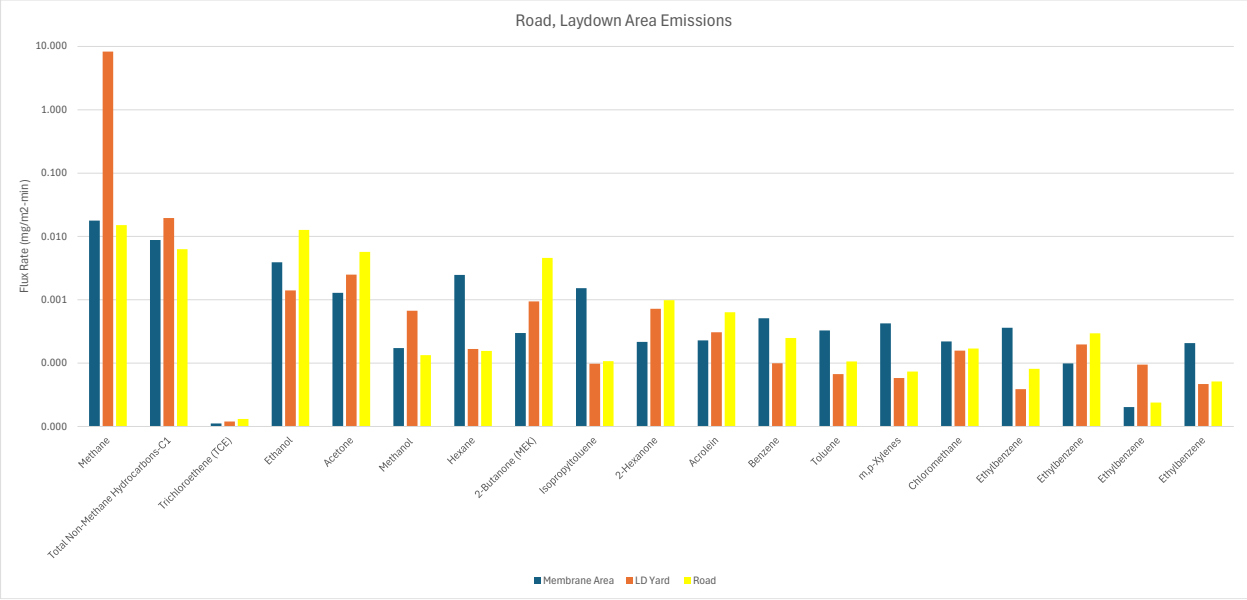
Relative Emission Rates from Roads and Laydown Areas.

For this test event, a section of road and a laydown area were tested to determine how the flux rate of compounds from the road surface/laydown area compared to the membrane surface. Figure 5.4 and 5.5 shows how the road and laydown area flux rate compared to the membrane flux rate for the TO-15 compounds and methane and VOC for Figure 5.4.

For most of the compounds the flux rates were very similar for the membrane surfaces as compared to the road and laydown area surfaces. The exceptions to this included:

1. The laydown area had a substantially higher methane flux rate than the membrane surfaces.
2. The road had higher flux rates for ethanol, acetone, and MEK than the membrane surface. However, this higher flux rate was due to one out of four test points.

Figure 5.4 Road/Laydown Area flux as compared to Membrane flux for Speciated Toxics (Logarithmic).



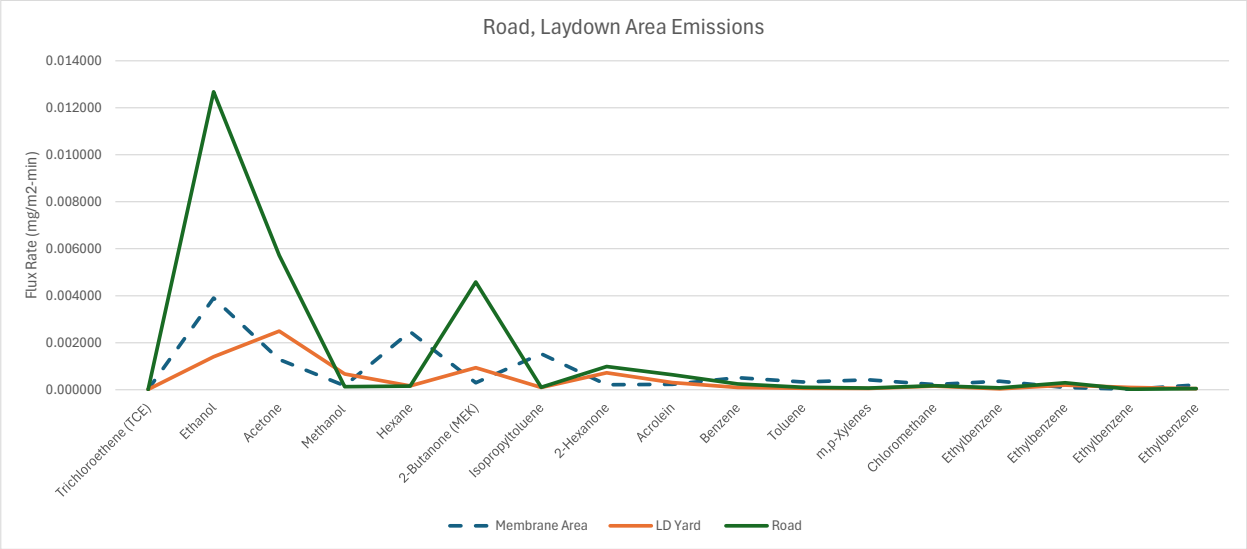


Figure 5.5 Road/Laydown Area flux as compared to Membrane flux for Speciated Toxics (Arithmetic).

EXECUTIVE SUMMARY

This Technical Memorandum documents the eighth air emissions testing event (July 2026). Field measurements were conducted by landfill screening experts at the Chiquita Canyon Landfill (Landfill) facility located at 29201 Henry Mayo Drive, Castaic, California in March 2026, to measure surface air emissions from the Landfill. Testing was performed using field screening for methane at the surface and following screening, in-depth area source testing using the U.S. Environmental Protection Agency (USEPA) surface emission isolation flux chamber technology as per the USEPA Guidance protocol (February 1986). This USEPA document provides the guidance for constructing and operating an agency approved area source measurement technology. The average flux (in units of mass per time per unit area) of surface emissions were calculated per category of grid cell (*i.e*., low, medium, high, exceedance) per type of landfill area (*i.e*., non-reaction area, membrane area, interface area, exceedance area, or anomalous cell area) as defined in the Assessment of Air Emissions from Landfill Surfaces (Emissions Report). These grid cell flux data multiplied by the number of grid cells in these categories when summed represent the air emissions of compounds from the Landfill surface.

The methane surface screening was conducted in similar fashion as to the USEPA New Source Performance Standards (NSPS) Title 40 Code of Federal Regulations (CFR) Part 60.755 (c) and (d), and CFR Part 60, Appendix A, Method 21 and the surface emissions monitoring (SEM) requirements contained within the California AB 32 Landfill Methane Rule (LMR) under Title 17 California Code of Regulations. The screening utilized the same grid system as is used in the Landfill regular South Coast Air Quality Management District (SCAQMD) Rule 1150.1 surface emissions monitoring, which consists of nominal one acre grid cells (approximately 50,000 square feet). A total vapor analyzer (TVA) instrument fit with a flame ionization detector (FID) was used along with global positioning system (GPS) location recording to map fugitive surface emissions in each grid cell.

As described in the Emissions Report, methane screening was performed by recording data along a traverse pattern that is spaced at 25 feet over the Landfill grid cells. Concentration data and location information was collected and used to generate integrated or average screening concentration of each grid cell. Grid cells within a category of interest were then ranked and divided into three groups: low emission, medium emission, and high emission per study area (*e.g*., membrane area, non-reaction area, interface area, etc.). Grid cells were selected for testing as described in the Emissions Report. The selected grid cells were screened on a point-by-point basis and representative low, medium, high, and the highest emission locations were selected for flux chamber testing. Samples collected from the flux chamber were sent offsite for laboratory

CE Schmidt, Ph.D.
Environmental Consultant

analysis. Note that an additional area was investigated and tested using the same screening and testing technologies as the other grid cells. A section of one of the dirt/gravel roads and an area called the Lay Down Yard on-site was tested in order to provide emission rate data from roads and this working yard as potential air emission sources.

A summary of the sampling program and testing efforts is provided below.

SOURCE	CATEGORY	SAMPLES
Grid Cell 175	Exceedance Area	4
Grid Cell 173	Membrane	4

Blanks	Blanks	5
Replicates	Replicates	5
TOTAL	TOTAL	70

The samples collected from the flux chamber for each location were used to calculate air emissions. The sample concentration data (mass per time) as received from the labs were reviewed, quality control (QC) data checks were performed, and tables were composed for total non-methane hydrocarbon compounds (TNMHC, C1), hydrocarbon species, hazardous air pollutants (HAPs), sulfur containing compounds, fixed gases (CO2, hydrogen, CH4), and trace gas species 1,1-difluoroethane (1,1-DFA, advective flow determination). This Technical Memorandum reports flux data for these study compounds along with the QC evaluation. Emission estimates for the study compounds are provided in the Emissions Report.

CE Schmidt, Ph.D.
Environmental Consultant

I. INTRODUCTION

This technical memorandum describes the field testing that was conducted to characterize surface or fugitive air emissions. The Landfill site is located in Castaic, California. As discussed in more detail in the Emissions Report, testing was conducted on July 20-24, 2026 by Dr. C.E. Schmidt, Mr. Tom Card, Mr. Josh Abbey, and Mr. Rich Wharton supported by a SCS Engineers sub-contractor, who performed landfill surface screening for methane prior to the test dates and during the testing program. Preparation for testing included submitting a Sampling Protocol (SP) that was approved by SCS Engineers and representatives of the South Coast Air Quality Management District (SCAQMD). A SCAQMD representative was present for a portion of the testing event.

The objective of the overall flux chamber study was to measure fugitive air emissions from grid cells that represented areas of the Landfill affected by the subsurface reaction (membrane, membrane/soil cover interface, and exceedance areas, working yard) as well as from areas unaffected by the reaction (non-reaction areas, road), as defined in the Emissions Report. The study was conducted by selecting representative test locations and conducting quantitative analysis of air emissions producing representative air emissions data.

This memorandum includes a discussion of the testing methodology, quality control procedures, and results. This memorandum only reports flux data per study compound and location.

Environmental Consultant

II. TEST METHODOLOGY

This section describes the methodologies used in the study for flux chamber testing, including evacuated canister and Tedlar® bag sample collection. Screening was performed in a fashion similar to the NSPS landfill screening protocol with additional criteria derived from the California LMR. Testing for surface flux was conducted using the USEPA recommended Surface Isolation Flux Chamber (USEPA, Radian Corporation, February 1986). Flux chamber sampling was performed on pre-selected Landfill grids as described in the Emissions Report and as directed by the SP.

Flux Chamber Sampling

As described in the USEPA User's Guide (February 1986), the flux chamber is an environmental or portable chamber also known as a mixed-tank reactor that is used to measure the 'flux' (mass transfer of study compounds per surface area of area source per time). Ultra-high purity air (sweep air) from a compressed air cylinder is regulated and added to the flux chamber at a flow of 5 liters per minute (lpm) until the chamber contents are well mixed. The chamber is a 'vented' chamber which releases or exhausts the chamber gas through the pressure equalization port in the top of the chamber to the atmosphere which keeps the chamber contents at atmospheric pressure during the measurement. Chamber mixing is described by a number of 'residence times.' A residence time in the chamber is determined by dividing the chamber volume by the sweep air flow rate. Following the User's Guide and with a chamber volume of 30 liters, the residence time is 6 minutes. Proper mixing in the chamber is achieved after five residence times or 30 minutes. After mixing, or after the chamber contents (sweep air plus compounds emitted into the chamber) are at equilibrium, gas samples are collected per regulatory approved methods described in the SP. Knowing the sweep air flow rate (5 lpm) plus any advective flow from the source, the area of the flux chamber on the test site (0.13 square meters), and the concentration of the study compounds, the flux of study compounds can be calculated (units of milligrams per square meter per minute, mg/m2,min). This Technical Memorandum reports directly measured flux data for the study compounds that are used in the Emissions Report.

The basic operation of the flux chamber involved the following:

1. Identifying the test area or test surface
2. Initiating sweep gas flow rate to the flux chamber
3. Operating the chamber for at least five residence times (30 minutes)
4. Collecting sample gas from the chamber for analysis
5. Decontaminating the chamber
6. Relocating the measurement equipment to the next test area

CE Schmidt, Ph.D.
Environmental Consultant

The specific operating protocol for flux chamber sampling was as follows:

1. Locate the flux chamber, sweep gas, sample collection equipment, and field documents at the test location.
2. Document site information, location information, equipment information, name of sampler, date, and time on the Emissions Measurement Data Sheets. (The data sheets are provided in Attachment A.)
3. Place the chamber approximately 1/4 inch into test surface at the test locations selected as described in the Emissions Report. Seal the chamber along the base to prevent air infiltration- sealing on membrane cover using clean fill soil making a barrier to air flow. Place thermocouples to monitor soil and air temperature inside and outside of the chamber.
4. Initiate the sweep gas flow rate and set the rotometer at 5.0 lpm. Maintain a constant sweep gas flow rate. Record time.
5. Collect instrument background data (thermocouple) and other parameters (see Emissions Measurement Data Sheets) and record data.
6. Connect the purge pump to the chamber. Purge the sample line from the flux chamber without exceeding the line purge rate (or sample gas collection rate) of 2.5 lpm; this prevents entraining of ambient air into the chamber.
7. Operate the chamber sweep air flow rate at 5.0 lpm and record data every residence time (6 minutes) for five residence times or 30 minutes. Record the flow rate and time data. Maintain the chamber at steady state. Purge the sample line and Tedlar bags from the flux chamber with at least 10 line-volumes of air as part of the odor bag sampling protocol using the decompression lung device, preparing the sample line for the balance of the sample media collection.
8. Connect the sample media sequentially (sulfur bag, and evacuated canister) to the purged sample line and collect the gas sample. Do not exceed a collection rate of 2.5 lpm at any time to prevent unwanted dilution of chamber exhaust gas by ambient air. Both the odor and sulfur bags are purged prior to sample collection; the evacuated canister is not purged.
9. Label sample bag and record sample collection on the data sheet.
10. Store the sample(s) in the appropriate storage and/or shipping container as specified in the SP.
11. Document sample collection in field data sheets (see Attachment A).
12. Discontinue the flux measurement, shut off the sweep air, remove chamber, and secure equipment.

13. Decontaminate the chamber where contact was made with the liquid or solid material using a clean paper towel and water (if needed) to remove any soil and condensation from the inside of the chamber.
14. Relocate equipment to the next test location and repeat steps 1 through 13.

Tedlar® Bag Sampling
Grab samples using Tedlar® bags were collected from the sample line from the flux chamber at steady-state conditions (five residence times) for analysis for sulfur containing species. Sampling rate was maintained at less than 2.5 lpm from the flux chamber. Bag samples were collected by connecting the sampling line from the flux chamber using 1/4-inch Swage-lock® fittings fit inside the decompression lung or pressure fittings, drawing a vacuum on the decompression lung, and filling the Tedlar® bag. Both sulfur bags (a, b) were purged and evacuated prior to sample collection in order to minimize sample bag interaction. Note two Tedlar bags were collected for sulfur species analysis according to the method.

Canister Sampling
Grab samples using Summa® polished, evacuated stainless steel canisters were collected from the exhaust line of the flux chamber at steady-state conditions for speciation by gas chromatography. Sampling rate was maintained at less than 2.5 lpm from the flux chamber. Canister samples were collected by connecting the canister to the sampling line from the flux chamber using 1/4-inch Swage-lock® fittings, drawing a vacuum from the canister and filling the canister. All canisters were batch certified by the laboratory according to USEPA Methods TO-15/TO-12/fixed gases/1,1-DFA trace gas and sampled to full capacity (atmospheric pressure).

III. QUALITY CONTROL

Control procedures that were used to assure that data of sufficient quality resulted from the flux chamber study are listed and described below. The application and frequency of these procedures were developed to meet the program data quality objectives as described in the SP for all analytical methods used in this study. Method detection limits for all sample data are provided in the attached laboratory reports.

Field Documentation – A field notebook containing data forms, including sample chain-of-custody (COC) forms, was maintained for the testing program. Attachment A contains the Emissions Measurement Data Sheets.

Chain-of-Custody – COC forms were used for field data collection. Field data were recorded on the COC forms provided in Attachment B. Calibration records and certifications are found in

Attachment D.

Total VOC as TNMHC by Analysis by USEPA Method TO-12, C1

Method QC Requirements – Method QC procedures were completed as per method requirements. These data are reported in the method specific lab reports (footnoted as applicable on the lab report showing compliance with the methods).

Laboratory Method Blank – A total of 16 laboratory method blank samples were performed by the laboratory. TNMHC compounds were not detected in the blank samples at the method detection limit (MDL) level of about 45 ppbV. These data indicate acceptable method performance.

Laboratory Precision – A total of 14 laboratory control duplicate (LCD) samples including nine compounds were performed by the laboratory. The LCD samples were reported within the criteria of less than 25% except for one sample that had one compound (1,3,5-trimethylbenzene) out of criteria. These data indicate acceptable method performance.

Laboratory Accuracy – A total of 14 laboratory control sample (LCS) or blank spike samples including nine compounds were performed by the laboratory. The LCS samples were reported within the criteria of 70-to-130 percent recovery except for one sample that had one compound (1,3,5-trimethylbenzene) out of criteria. These data indicate acceptable method performance.

Field System Blank – Five media (field) blank samples were prepared in the field (T-114, -214, -314, -414, -514) and were analyzed as field samples (blind QC sample). Field blanks were prepared by filling the sampling media with ultra high purity air in the field and treated as a field sample. All five field blank samples show non-detect (MDL 30 ppbv). These data demonstrate acceptable method performance.

Field Method Precision – Five field samples were collected in replicate (second sample taken immediately after the first sample for method precision data) and analyzed for the flux chamber testing (T-112/-113, T-212/-213, T-312/-313, T-412/-413, T-512/-513). The range of sample/replicate pairs was 17 to 40 with an average RPD of 23 (QC criteria 50 RPD). No sample/replicate pairs exceeded criteria at 50 RPD. These data demonstrate acceptable method performance.

Hydrocarbon Species Analysis by USEPA Method TO-14

Method QC Requirements – Method QC procedures were completed as per method requirements. These data are reported in the method specific lab reports (footnoted as applicable on the lab report showing compliance with the methods).

CE Schmidt, Ph.D.
Environmental Consultant

Laboratory Method Blank – A total of 16 laboratory method blank samples were performed by the laboratory. Hydrocarbon compounds (full list) were not detected in the blank samples at the method detection limit (MDL) level of 6 ug/m3 to 7 ug/m3. These data indicate acceptable method performance.

Laboratory Precision – A total of 14 laboratory control duplicate (LCD) samples including nine compounds were performed by the laboratory. The LCD samples were reported within the criteria of less than 25% except for one sample that had one compound (1,3,5-trimethylbenzene) out of criteria. These data indicate acceptable method performance.

Laboratory Accuracy – A total of 14 laboratory control sample (LCS) or blank spike samples including nine compounds were performed by the laboratory. The LCS samples were reported within the criteria of 70-to-130 percent recovery except for one sample that had one compound (1,3,5-trimethylbenzene) out of criteria. These data indicate acceptable method performance.

Field System Blank –Five media (field) blank samples were prepared in the field (T-114, -214, -314, -414, -514) and were analyzed as field samples (blind QC sample). Field blanks were prepared by filling the sampling media with ultra high purity air in the field and treated as a field sample. Three of five field blank samples showed non-detect, and two of the five field blank samples showed up to three compounds, all less than reporting limits or 'J' flagged concentrations: T-214 propene 5.3J ug/m3, propane 6.09J ug/m3, and n-hexane 2.91Jug/m3, and T-414 ethane 4.42J ug/m3 and propane 6.09J ug/m3. None of these detects are above the reporting limits. These data demonstrate acceptable method performance.

Field Method Precision – Five field samples were collected in replicate (second sample taken immediately after the first sample for method precision data) and analyzed for the flux chamber testing (T-112/-113, T-212/-213, T-312/-313, T-412/-413, T-512/-513). Sample/replicate pair (T-113/-114 had 3 detections above J value limits with 1 of 3 pairs exceeding RPD criteria, a range of RPD of 40 to 69, and an average RPD of 53. Sample/replicate pair T-212/-213 had 30 detections above J value limits with 5 of 30 pairs exceeding RPD criteria, a range of RPD of 5.2 to 94, and an average RPD of 33. Sample/replicate pair T-313/-314 had one detection above J value limits with one of one pair exceeding RPD criteria. Sample/replicate pair T-412/-413 had 13 detections above J value limits with 2 of 13 pairs exceeding RPD criteria, a range of RPD of 5.2 to 44, and an average RPD of 44. And sample/replicate pair T-512/-513 had one detection above J value limits not exceeding RPD criteria a RPD of 37. Although many compounds were detected, in this precision sample set, many were reported above detection limits but less than reporting limits and assigned 'J' value data flags. Only the sample/replicate pairs with response both greater than

CE Schmidt, Ph.D.
Environmental Consultant

reporting limits (not 'J' value flagged) were used in evaluating field precision. Given the low values (less precise and below reporting limits) and the large number of compounds reported in some samples (compound peak separation poor), the precision was poor for this sample/replicate data set. However, since the laboratory method precision criteria were acceptable, the field precision data although poor, do not indicate a systematic problem with the TO-14 analysis. As such, these data demonstrate acceptable method performance.

Individual HAP Analysis by USEPA Method TO-15

Method QC Requirements – Method QC procedures were completed as per method requirements including recovery of surrogate compounds. These data are reported in the method specific lab reports.

Laboratory Method Blank – A total of nine laboratory method blank samples were performed by the laboratory. No compounds were detected in the blank samples above the compound specific MDL levels (range of about 2-to-26 ug/m^3) with the exception of propylene found in three of the nine samples with a range of 0.82J ug/m3 to 1.54J ug/m3. These data indicate acceptable method performance.

Precision – A total of nine laboratory LCD samples including 18 compounds were performed by the laboratory. All LCD samples were reported within the criteria of less than 25%. These data indicate acceptable method performance.

Laboratory Accuracy – A total of nine laboratory LCS samples including 18 compounds were performed by the laboratory. All LCS samples were reported within the criteria of 70-to-130 percent recovery. These data indicate acceptable method performance.

Field System Blank – Five media (field) blank samples were prepared in the field (T-114, -214, -314, -414, -514) and were analyzed as a field sample (blind QC sample). Field blanks were prepared by filling the sampling media with ultra high purity air in the field and treated as a field sample. Only one sample, T-414, had one compound (acetone) above method detection limit (MDL) at 9.72 ug/m3. No other compounds were detected above MDL (range of 1.4 to 26 ug/m^3) in the five field blank samples. However four other compounds including propylene, hexane, benzene, and isopropyl toluene were found reported as 'J' values or below MDL in one or more of the blanks, including: T-114 propylene 1.46J ug/m3 and hexane 3.02J ug/m3; T-214 propylene 1.45J ug/m3; T-314 propylene 0.95J ug/m3; T-414 propylene 1.61J ug/me, acetone 5.35J ug/m3; T-414 propylene 1.61J ug/m3 and benzene 5.26J ug/m3; and T-514 acetone 4.82J ug/m3 and isopropyl toluene 4.83J ug/m3. These data demonstrate acceptable method performance.

Environmental Consultant

Field Method Precision – Five field samples were collected in replicate and analyzed for the flux chamber testing (T-112/-113, T-212/-213, T-312/-313, T-412/-413, T-512/-513), the second sample taken immediately after the first sample for method precision data. The sample/replicate pair T-112/-113 showed 17 compound pairs above reporting limits with a RPD range of 0.64 to 29, average RPD 11, and no compound pairs exceeded criteria (RPD 50). The sample/replicate pair T-212/-213 showed 32 compound pairs above reporting limits with a RPD range of 0.21 to 33, average RPD of 6.7 and no compound pairs exceeded criteria (RPD 50). The sample/replicate pair T-312/-313 showed 12 compound pairs above reporting limits with a RPD range of 2.0 to 63, average RPD of 37 and 4 of 12 compound pairs exceeded criteria (RPD 50). The sample/replicate pair T-412/-413 showed 30 compound pairs above reporting limits with a RPD range of 0.69 to 159, average RPD of 33 and 5 compound pairs exceeded criteria (RPD 50). The sample/replicate pair T-512/-513 showed 7 compound pairs above reporting limits with a RPD range of 3.7 to 60, average RPD of 24 and one compound pair exceeded criteria (RPD 50). There was a higher number of RPD exceedances in this data set but there was also a larger number of compounds detected with often high level and low level detections in these samples, which always affects field replicate sample precision. Note that the average RPD for the sample/replicate pairs all were within criteria. Overall, these data demonstrate acceptable method performance.

SCAQMD 307.91 Analysis for Hydrogen Sulfide

Method QC Requirements – Method QC procedures were completed as per method requirements. These data are reported in the method specific lab reports. Twenty QC standard QC data sets were run in total (four each on five batches) on the samples for the instrument used in analyzing the samples; four runs on the first two batches each and two on the third batch of samples. In summary, the opening calibration verification standard and duplicate analysis QC (95%-105%, <5 RPD), method blank QC (<pql), standard and duplicate standard analysis QC (95%-105%, <10%), matrix spike/ QC (<10%), and closing calibration curve verification standard QC (90-110%) for both instruments used in the analyses were within the method requirements. These data indicate acceptable performance. Note that each sample was collected in duplicate (a, b) and samples indicated with a sample ID of 'a' were analyzed.

Field System Blank – Five media (field) blank samples were prepared in the field (S-114, S-214, S-314, S-414, S-514) and were analyzed as field samples (blind QC sample). Field blanks were prepared by filling the sampling media with ultra high purity air in the field and treated as a field sample. Hydrogen sulfide and other reduced sulfur compounds were not detected in the five blank samples at a level of 0.005 ppmv. These data demonstrate acceptable method performance.

Field Method Precision – Five field samples were collected in replicate and analyzed for the flux chamber testing (S-112/-113, S-212/-213, S-312/-313, S-412/-413, S-512/-513), the second

CE Schmidt, Ph.D.
Environmental Consultant

sample taken immediately after the first sample for method precision data. All sample/replicate pairs showed non detect for all study compounds; one sample pair had one of two detects just above detection (9.995 ppmv). These data indicate acceptable method performance.

ASTM 1945/USEPA 3C for Fixed Gases (methane and carbon dioxide)
Method QC Requirements – Method QC procedures were completed as per method requirements.

Laboratory Method Blank – One laboratory method blank sample was performed by the laboratory. Fixed gases were not detected in the blank samples above the MDL that ranged between 0.01% to 0.05%. These data indicate acceptable method performance.

Laboratory Precision – One LCD sample was performed by the laboratory. The LCD sample was reported within the criteria of less than 25%. These data indicate acceptable method performance.

Laboratory Accuracy – One LCS sample was performed by the laboratory. The LCS sample was reported within the criteria of 70-to-130 percent recovery. These data indicate acceptable method performance.

Field System Blank (accuracy) – Five media (field) blank samples were prepared in the field (T-114, -214, -314, -414, -514) and were analyzed as field samples (blind QC sample). Field blanks were prepared by filling the sampling media with ultra high purity air in the field and treated as a field sample. Carbon dioxide was not detected above the MDL (0.01%) and methane was detected near the detection limit in three samples between 1.3 to 2.0 ppmv (MDL 0.77 ppmv or less). These data demonstrate acceptable method performance.

Field Method Precision – Five field samples were collected in replicate and analyzed for the flux chamber testing (T-112/-113, T-212/-213, T-312/-313, T-412/-413, T-512-513), with the second sample taken immediately after the first sample for method precision data. Two of the sample replicate pairs for carbon dioxide had values above MDL at RPD values of 14 and 12; the others were below method detection limit. Likewise two of the sample replicate pairs for methane were above MDL and had RPD values of 15 and 27 (criteria RPD 50). These data indicate acceptable method performance.

Trace Gas 1,1-DFA Analysis by USEPA Method TO-15
Method QC Requirements – Method QC procedures were completed as per method requirements.

Laboratory Method Blank – A total of nine laboratory method blank samples were performed by the laboratory. 1,1-DFA was not detected in the blank samples at the MDL of 2.7 ug/m3. These

CE Schmidt, Ph.D.
Environmental Consultant

data indicate acceptable method performance.

Laboratory Precision – Nine LCD samples were performed by the laboratory. The LCD samples were reported within the criteria of less than 25%. These data indicate acceptable method performance.

Laboratory Accuracy – Nine LCS samples were performed by the laboratory. The LCS samples were reported within the criteria of 70-to-130 percent recovery. These data indicate acceptable method performance.

Field System Blank – Five media (field) blank samples were prepared in the field (T-114, -214, -314, -414, -514) and were analyzed as field samples (blind QC sample). Field blanks were prepared by filling the sampling media with ultra high purity air in the field and treated as a field sample. Given that these blank samples were taken from a calibration standard gas, these data serve as accuracy data or sample recovery QC data (±30%). The range of percent recovery for the five samples was 85%-to-99%. These data demonstrate acceptable method performance.

Field Method Precision – Five field samples were collected in replicate and analyzed for the flux chamber testing (T-112/-113, T-212/-213, T-312/-313, T-412/-413, T-512/-513), with the second sample taken immediately after the first sample for method precision data. The RPD values ranged from 0.54 to 16, average RPD of 8.3 (QC criteria (50 RPD). These data indicate acceptable method performance.

Field Calibration of the TVA-1000/MicroFid; Screening for Total Hydrocarbon Concentration
Pre-Use and Post-Use Instrument Response to Span (calibration) Gas and Zero Air (pure air)
The MicroFid Photovac and TVA-1000, instruments with FID detectors, were pre-use and post-use calibrated each day of use using certified methane span gas standard at either 25 ppmv or 100 ppmv. Zero air checks were generally acceptable, and all span checks were generally within 70%-to-130% accuracy, indicating acceptable instrument performance. However there was significant drift with temperature and direct sunlight exposure causing instrument drift and poor performance on occasion. The cooler morning startups did cause higher blank levels and recalibration during the day as the ambient temperature increased. Regardless the hydrocarbon detection instruments did provide useful screening data. No field data (MicroFid FID or the TVA-1000) were used in the emissions calculations; these data were only used in the field for directive purposes.

Field Calibration of the J-631X; Screening for Hydrogen Sulfide
Pre-Use and Post-Use Instrument Response to Zero Air
The two J-631X hydrogen sulfide analyzers were pre-use and post-use zero air checked and re-

CE Schmidt, Ph.D.
Environmental Consultant

zeroed without exception and often many times during the day. These field screening instruments performed well however were the daily temperature swing affected instrument sensitivity and response. The cooler morning startups did cause higher blank levels and high/low response recalibration during the day as the ambient temperature increased, however the instrument did provide useful screening data. Each analyzer seemed to have different sensitivity, and measurements were performed and recorded for both analyzers for each instrument as possible. One instrument came with charging issues and calibration issues which were resolved by talking with the rental company instrument technician. For that time period only one instrument was used. No field data (J-631X) were used in the emissions calculations; these data were only used in the field for directive purposes.

IV. RESULTS AND DISCUSSIONS

A summary of the field sample collection information and field data for the field testing is shown in Table 1. All field data for the surface flux chamber testing and sample identification information are presented in Table 2. Table 2 provides both concentration (%, ug/m^3, mg/m^3) and flux (mg/m^2,min) data. All laboratory data, including quality control data, are presented in Attachment C to this memorandum. TO-15 data is presented in Table 3, TO-14 data is presented in Table 4, and SCAQMD 307-91 data is presented in Table 5.

Surface flux data are shown in flux units for compound emissions (mg/m^2,min). Surface flux for a surface area source is calculated using measured target compound concentrations and flux chamber operating parameter data (sweep air flow rate of 5.0 lpm [or 0.005 cubic meters per minute (m^3/min) plus advective flow], surface area of 0.13 square meters [m^2]). The site emissions can be calculated by multiplying the flux by the surface area of the grid cell or source tested. The flux (Fi, mg/m2,min) is calculated from the sweep air flow rate (Q, m^3/min)), the compound concentration (Yi, mg/m^3), and exposure to the chamber surface area (A, m^2)), as follows:

$$Fi = (Q)\ (Yi) / (A)$$

Emission rate (mass per time) from a source tested using the flux chamber technology can be obtained by multiplying unit or average flux data per compound by the surface area of the source. Note that advective flow at each test location was determined by the dilution of the 208 ppbV 1,1-DFA trace gas as is the protocol for SCAQMD Rule 1133.3, Attachment A (alternative to using 10% helium as allowed by the method).

1,1-DFA was used as a trace gas at 200 ppbv in ultra high purity air as the sweep gas necessary to perform the flux measurements. The recovery of a trace gas in the assessment allows for the

CE Schmidt, Ph.D.
Environmental Consultant

gas flow into the chamber from the Landfill or the advective flow from the Landfill. 1,1-DFA was selected as a trace gas and approved by the SCAQMD given that it is not a greenhouse gas and is not used as a commercial freon compound. The trace gas analysis provided advective flow data within QC standards for all samples except one sample, T-406 where the value reported in the analysis was 1.97 ppbv very near the detection limit where it should have been much like the other samples in the grid, between approximately 130 to 200 ppbv. The sample was re-analyzed by the laboratory and found to be correct. It appears at the sample supply line, which is thin wall ¼" Teflon tubing, the reported value may have resulted from restricted sweep-gas flow (e.g. a kinked line), stopping sweep air flow to the chamber at this location providing no advective flow data. The trace gas flow detection for this sample was replaced with the average flow for the other three grid cell measurements and used in the flux calculation so noted in data Table 2.

The flux of VOCs as TNMHC (C1), HAPs compounds, hydrocarbon species, sulfur containing compounds, and fixed gases (methane, hydrogen, and carbon dioxide) from the Landfill grid cells tested is provided in this Technical Memorandum and is used in the Emissions Report.

The data set met the QC requirements provided in the SP and the laboratory methods employed.

V. SUMMARY

A focused air emissions assessment was performed on the Landfill at the facility located in Castaic, California. Areas of the Landfill that were tested included grid cells representative of both areas of the Landfill affected by the reaction and areas of the Landfill not affected by the reaction. Surfaces in the reaction area that were covered with a synthetic membrane were also tested as the technical approach included those grid cells by SEM screening like other grid cells on site. The following is a summary of activities and results associated with this Technical Memorandum:

- Surface flux measurements of VOCs as TNMHC, hydrocarbon species, HAPs compounds, sulfur containing compounds, and fixed gases (methane, carbon dioxide, 1,1-DFA) were measured at 15 selected Landfill locations (13 grid cells, one laydown yard, and one road section). The scope of work was expanded to investigate other areas of interest on the Landfill. Four flux chamber measurements were taken from each grid cell.

- Grid selection was based on the areas of interest (i.e., membrane area, non-reaction area, interface area, etc.) and methane surface screening data.

- Emissions testing was performed using the USEPA recommended surface flux chamber technology as described in the USEPA User's Guide for assessing fugitive air emissions

from area sources. Surface advective flow was determined at each location by the dilution of a trace gas 1,1-DFA added to the chamber sweep air. Study compounds were tested following regulatory approved sampling and analytical methods. These technologies were used to quantitatively measure flux at the test surface of the listed study compounds.

- Field and laboratory quality control data indicate acceptable data quality for all of the analytical methods used. Lab method QC sample data and media/field blank sample data for the analytical methods were found to be acceptable according to the methods used. Method precision for the lab replicates and spike samples (LCD and LCS) met the method criteria. Field method blank samples and field replicate samples were also acceptable, however some field precision samples for some methods, namely TO-14 and TO-15, exceeded criteria for some sample/replicate pairs. This was likely due to the low levels and numerous detections found in many samples, especially for Method TO-14 or hydrocarbon speciation analysis. In particular the poor precision with some of the TO-14 sample/replicate pairs was related to the large number of compounds detected near the reporting limits. The data set is of acceptable data quality for the purpose of assessing compound emissions from the Landfill.

- The flux data generated in this field study can be used to estimate emission factors from the Landfill area sources tested.

LABORATORY REPORTS

19200 Live Oak Road Red Bluff, CA 96080 (530) 529-4256 Fax- 4878

Atmospheric Analysis & Consulting, Inc

CLIENT	: Environmental Management Consulting
PROJECT NAME	: SCS Chiquita Canyon Landfill
PROJECT NUMBER	: CES F1-02106
AAC PROJECT NO.	: 261701
REPORT DATE	: 07/29/2026

On July 20th 2026, Atmospheric Analysis & Consulting, Inc. received twenty eight (28) Tedlar Bags for Total Reduced Sulfur analysis by SCAQMD 307.91. Upon receipt, the samples were assigned unique Laboratory ID numbers as follows:

Client ID	AAC ID	Client ID	AAC ID
S-101a	261701-92450	S-108a	261701-92464
S-101b	261701-92451	S-108b	261701-92465
S-102a	261701-92452	S-109a	261701-92466
S-102b	261701-92453	S-109b	261701-92467
S-103a	261701-92454	S-110a	261701-92468
S-103b	261701-92455	S-110b	261701-92469
S-104a	261701-92456	S-111a	261701-92470
S-104b	261701-92457	S-111b	261701-92471
S-105a	261701-92458	S-112a	261701-92472
S-105b	261701-92459	S-112b	261701-92473
S-106a	261701-92460	S-113a	261701-92474
S-106b	261701-92461	S-113b	261701-92475
S-107a	261701-92462	S-114a	261701-92476
S-107b	261701-92463	S-114b	261701-92477

This analysis is performed in accordance with AAC's Quality Manual. Test results apply to the sample(s) as received. For detailed information pertaining to specific EPA, NCASI, ASTM and SCAQMD accreditations (Methods & Analytes), please visit our website at www.aaclab.com.

I certify that this data is technically accurate, complete, and in compliance with the terms and conditions of the contract. Per client request, samples "S-1xx-b" were held as backup and therefore not analyzed. No problems were encountered during receiving, preparation, and/or analysis of these samples. The Technical Director or his/her designee, as verified by the following signature, has authorized release of the data.

If you have any questions or require further explanation of data results, please contact the undersigned.

Sucha Parmar, Ph.D.
Technical Director

Atmospheric Analysis & Consulting, Inc.

CLIENT	: Environmental Management Consulting
PROJECT NAME	: SCS Chiquita Canyon Landfill
PROJECT NUMBER	: CES F1-02106
AAC PROJECT NO.	: 261721
REPORT DATE	: 07/29/2026

On July 21st 2026, Atmospheric Analysis & Consulting, Inc. received twenty eight (28) Tedlar Bags for Total Reduced Sulfur analysis by SCAQMD 307.91. Upon receipt, the samples were assigned unique Laboratory ID numbers as follows:

Client ID	AAC ID	Client ID	AAC ID
S-201a	261721-92532	S-208a	261721-92546
S-201b	261721-92533	S-208b	261721-92547
S-202a	261721-92534	S-209a	261721-92548
S-202b	261721-92535	S-209b	261721-92549
S-203a	261721-92536	S-210a	261721-92550
S-203b	261721-92537	S-210b	261721-92551
S-204a	261721-92538	S-211a	261721-92552
S-204b	261721-92539	S-211b	261721-92553
S-205a	261721-92540	S-212a	261721-92554
S-205b	261721-92541	S-212b	261721-92555
S-206a	261721-92542	S-213a	261721-92556
S-206b	261721-92543	S-213b	261721-92557
S-207a	261721-92544	S-214a	261721-92558
S-207b	261721-92545	S-214b	261721-92559

This analysis is performed in accordance with AAC's Quality Manual. Test results apply to the sample(s) as received. For detailed information pertaining to specific EPA, NCASI, ASTM and SCAQMD accreditations (Methods & Analytes), please visit our website at www.aaclab.com.

I certify that this data is technically accurate, complete, and in compliance with the terms and conditions of the contract. Per client request, samples "S-2xx-b" were held as backup and therefore not analyzed. No problems were encountered during receiving, preparation, and/or analysis of these samples. The Technical Director or his/her designee, as verified by the following signature, has authorized release of the data.

If you have any questions or require further explanation of data results, please contact the undersigned.

Sucha Parmar, Ph.D.
Technical Director

Atmospheric Analysis & Consulting, Inc.

CLIENT	:	Environmental Management Consulting
PROJECT NAME	:	SCS Chiquita Canyon Landfill
PROJECT NUMBER	:	CES F1-02106
AAC PROJECT NO.	:	261732
REPORT DATE	:	07/30/2026

On July 22nd 2026, Atmospheric Analysis & Consulting, Inc. received twenty eight (28) Tedlar Bags for Total Reduced Sulfur analysis by SCAQMD 307.91. Upon receipt, the samples were assigned unique Laboratory ID numbers as follows:

Client ID	AAC ID	Client ID	AAC ID
S-301a	261732-92633	S-308a	261732-92647
S-301b	261732-92634	S-308b	261732-92648
S-302a	261732-92635	S-309a	261732-92649
S-302b	261732-92636	S-309b	261732-92650
S-303a	261732-92637	S-310a	261732-92651
S-303b	261732-92638	S-310b	261732-92652
S-304a	261732-92639	S-311a	261732-92653
S-304b	261732-92640	S-311b	261732-92654
S-305a	261732-92641	S-312a	261732-92655
S-305b	261732-92642	S-312b	261732-92656
S-306a	261732-92643	S-313a	261732-92657
S-306b	261732-92644	S-313b	261732-92658
S-307a	261732-92645	S-314a	261732-92659
S-307b	261732-92646	S-314b	261732-92660

This analysis is performed in accordance with AAC's Quality Manual. Test results apply to the sample(s) as received. For detailed information pertaining to specific EPA, NCASI, ASTM and SCAQMD accreditations (Methods & Analytes), please visit our website at www.aaclab.com.

I certify that this data is technically accurate, complete, and in compliance with the terms and conditions of the contract. Per client request, samples "S-3xx-b" were held as backup and therefore not analyzed. No problems were encountered during receiving, preparation, and/or analysis of these samples. The Technical Director or his/her designee, as verified by the following signature, has authorized release of the data.

If you have any questions or require further explanation of data results, please contact the undersigned.

Sucha Parmar, Ph.D.
Technical Director

Atmospheric Analysis & Consulting, Inc.

CLIENT	: Environmental Management Consulting
PROJECT NAME	: SCS Chiquita Canyon Landfill
PROJECT NUMBER	: CES F1-02106
AAC PROJECT NO.	: 261740
REPORT DATE	: 07/31/2026

On July 23rd 2026, Atmospheric Analysis & Consulting, Inc. received twenty eight (28) Tedlar Bags for Total Reduced Sulfur analysis by SCAQMD 307.91. Upon receipt, the samples were assigned unique Laboratory ID numbers as follows:

Client ID	AAC ID	Client ID	AAC ID
S-401a	261740-92689	S-408a	261740-92703
S-401b	261740-92690	S-408b	261740-92704
S-402a	261740-92691	S-409a	261740-92705
S-402b	261740-92692	S-409b	261740-92706
S-403a	261740-92693	S-410a	261740-92707
S-403b	261740-92694	S-410b	261740-92708
S-404a	261740-92695	S-411a	261740-92709
S-404b	261740-92696	S-411b	261740-92710
S-405a	261740-92697	S-412a	261740-92711
S-405b	261740-92698	S-412b	261740-92712
S-406a	261740-92699	S-413a	261740-92713
S-406b	261740-92700	S-413b	261740-92714
S-407a	261740-92701	S-414a	261740-92715
S-407b	261740-92702	S-414b	261740-92716

This analysis is performed in accordance with AAC's Quality Manual. Test results apply to the sample(s) as received. For detailed information pertaining to specific EPA, NCASI, ASTM and SCAQMD accreditations (Methods & Analytes), please visit our website at www.aaclab.com.

I certify that this data is technically accurate, complete, and in compliance with the terms and conditions of the contract. Per client request, samples "S-4xx-b" were held as backup and therefore not analyzed. No problems were encountered during receiving, preparation, and/or analysis of these samples. The Technical Director or his/her designee, as verified by the following signature, has authorized release of the data.

If you have any questions or require further explanation of data results, please contact the undersigned.

Sucha Parmar, Ph.D.
Technical Director

Atmospheric Analysis & Consulting, Inc.

CLIENT	: Environmental Management Consulting
PROJECT NAME	: SCS Chiquita Canyon Landfill
PROJECT NUMBER	: CES F1-02106
AAC PROJECT NO.	: 261749
REPORT DATE	: 08/03/2026

On July 24th 2026, Atmospheric Analysis & Consulting, Inc. received twenty eight (28) Tedlar Bags for Total Reduced Sulfur analysis by SCAQMD 307.91. Upon receipt, the samples were assigned unique Laboratory ID numbers as follows:

Client ID	AAC ID	Client ID	AAC ID
S-501a	261749-92789	S-508a	261749-92803
S-501b	261749-92790	S-508b	261749-92804
S-502a	261749-92791	S-509a	261749-92805
S-502b	261749-92792	S-509b	261749-92806
S-503a	261749-92793	S-510a	261749-92807
S-503b	261749-92794	S-510b	261749-92808
S-504a	261749-92795	S-511a	261749-92809
S-504b	261749-92796	S-511b	261749-92810
S-505a	261749-92797	S-512a	261749-92811
S-505b	261749-92798	S-512b	261749-92812
S-506a	261749-92799	S-513a	261749-92813
S-506b	261749-92800	S-513b	261749-92814
S-507a	261749-92801	S-514a	261749-92815
S-507b	261749-92802	S-514b	261749-92816

This analysis is performed in accordance with AAC's Quality Manual. Test results apply to the sample(s) as received. For detailed information pertaining to specific EPA, NCASI, ASTM and SCAQMD accreditations (Methods & Analytes), please visit our website at www.aaclab.com.

I certify that this data is technically accurate, complete, and in compliance with the terms and conditions of the contract. Per client request, samples "S-5xx-b" were held as backup and therefore not analyzed. No problems were encountered during receiving, preparation, and/or analysis of these samples. The Technical Director or his/her designee, as verified by the following signature, has authorized release of the data.

If you have any questions or require further explanation of data results, please contact the undersigned.

Sucha Parmar, Ph.D.
Technical Director

Red Bluff, CA 96080

Chuck ,

Enclosed is the analytical report for the samples received and analyzed by Environmental Analytical Service, Inc. for the following Project.

Client Project Name: Chiquita Canyon
PO Number:
Client Project Number:
Sample Event Date: 7/20-7/24/2026

If you have any questions on the report or the analytical data please contact me at (805) 781-3585.

Sincerely

Steven D. Hoyt Ph.D.
Laboratory Director

Analytical Report

Project Name:

Chiquita Canyon

EAS SDG Number: **226144**

Client Project Manager: Chuck Schmidt

Prepared For:
C.E. Schmidt
19200 Live Oak Road
Red Bluff CA 96080

Project Number: 17807
Sample Event Date: 7/20-7/24/2026
Received Date: 7/24/2026
Report Date: 9/3/2026

Project Number:
PO Number:

This is the Laboratory Report for the samples in the indicated Sample Delivery Group (SDG). Each sample received in the group is assigned a Laboratory ID number. The combination of the SDG number and the Lab ID number is an unique identifier for the sample.

This Report Contains:

Laboratory Work Order
Project Sample Media
Laboratory Case Narrative and Chain of Custody
Method Description (when applicable)
Quality Control Reports
Analytical Reports

NELAC Certification: Florida E871125

173 Cross Street, San Luis Obispo, CA 93401 (805) 781-3585

Laboratory Work Order

SDG Number: 226144
Client: Chuck Schmidt
C.E. Schmidt

Project Number: 17807
Received: 7/24/2026

SAMPLE DESCRIPTION AND ANALYSIS REQUESTED

Client Sample ID	EAS Lab No.	Analysis Requested	Date Sampled
T-101	226144 1	ASTM D1945 Permanent Gas Analysis	7/20/2026
T-101	226144 1	ASTM D3416 Low Level Methane	7/20/2026
T-101	226144 1	EPA TO-12 C2 to C12 CRYO	7/20/2026
T-101	226144 1	EPA TO-15 Full List 95 + 1,1 DFA,Acrolein + TIC 1	7/20/2026
T-101	226144 1	ASTM D1945 Hydrogen Confirmation	7/20/2026
T-102	226144 2	ASTM D1945 Hydrogen Confirmation	7/20/2026
T-102	226144 2	ASTM D1945 Permanent Gas Analysis	7/20/2026
T-102	226144 2	ASTM D3416 Low Level Methane	7/20/2026
T-102	226144 2	EPA TO-12 C2 to C12 CRYO	7/20/2026
T-102	226144 2	EPA TO-15 Full List 95 + 1,1 DFA,Acrolein + TIC 1	7/20/2026
T-103	226144 3	ASTM D1945 Hydrogen Confirmation	7/20/2026
T-103	226144 3	EPA TO-15 Full List 95 + 1,1 DFA,Acrolein + TIC 1	7/20/2026
T-103	226144 3	EPA TO-12 C2 to C12 CRYO	7/20/2026
T-103	226144 3	ASTM D1945 Permanent Gas Analysis	7/20/2026
T-103	226144 3	ASTM D3416 Low Level Methane	7/20/2026
T-104	226144 4	ASTM D1945 Hydrogen Confirmation	7/20/2026
T-104	226144 4	ASTM D1945 Permanent Gas Analysis	7/20/2026
T-104	226144 4	ASTM D3416 Low Level Methane	7/20/2026
T-104	226144 4	EPA TO-12 C2 to C12 CRYO	7/20/2026
T-104	226144 4	EPA TO-15 Full List 95 + 1,1 DFA,Acrolein + TIC 1	7/20/2026
T-105	226144 5	EPA TO-12 C2 to C12 CRYO	7/20/2026
T-105	226144 5	ASTM D1945 Hydrogen Confirmation	7/20/2026
T-105	226144 5	EPA TO-15 Full List 95 + 1,1 DFA,Acrolein + TIC 1	7/20/2026

Client Sample ID	EAS Lab No.	Analysis Requested	Date Sampled
T-105	226144 5	ASTM D1945 Permanent Gas Analysis	7/20/2026

Project Sample Media

SDG Number: 226144

The following sample media was used for this Sample Delivery Group (SDG). The Sample Media column identifies the type of media. For canisters, the Sample Media Batch gives the canister number followed by the cleaning batch number, which is a unique identification. The initial pressure of the canister when it is received is recorded. If the canister is not pressurized, the final pressure will be the same as the initial pressure. If the canister is pessurized the final pressure will be recorded, and the canister dilution factor is calculated as the ratio of the final to initial pressure. The results are adjusted for the can dilution factor.

SDG	Lab ID	Client Sample No.	Sample Media	Batch	Pressure, torr Initial	Pressure, torr Final	Can Factor

Laboratory Case Narrative

EAS SDG Number: 226144 **Project Number:** 17807

Client: C.E. Schmidt

The Laboratory Case Narrative for the SDG is below. The Chain of Custody form(s) follow the Laboratory Case Narrative.

Sample Control Narrative

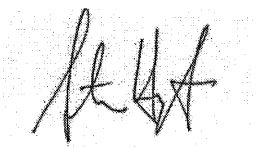
The samples were all received in good condition and with proper preservation.

Analytical Methods

The methods used for sample analysis are listed on the Analytyical Report header, and have been modified as described in the EAS Quality Manual..

Case Narrative

QC Narrative



All analyses met EAS method criteria as defined in the Quality Manual, except as noted in the report or QC reports with data qualifiers.

Subcontract Narrative

No sample analysis was subcontracted for this project

Laboratory Certification

I certify that this data package is in compliance with the terms and conditions of the contract, both technically and for completeness other than the condition(s) noted above. The Laboratory Report is property of EAS and its client. The entire report has been reviewed and approved.

Date Approved: 9/3/2026

Steven D. Hoyt, Ph.D.
Environmental Analytical Service
Laboratory Director

Quality Control Report

EAS SDG Number: 226144

Project Number: 17807

QC Narrative

Samples were anlayzed in a daily analytical batch (DAB) designated by a QC batch number, and were analyzed using EAS standard laboratory QC specified in the EAS Quality Manual which may be different then the referrenced agency method. Any deviations from the EAS QC criteria are flagged in the Laboratory Control Reports or in the sample Analytical Reports.

Standard Laboratory QC Report

Unless project specific QC was requested, this Section containing the standard laboratory QC (Level 2) supplied with the Analytical Reports. Each sample is analyzed in a Daily Analytical Batch (DAB) which includes the method blank, a laboratory control spike (LCS) and a laboratory control duplicate (LCD). A Daily Analytical Batch QC report is supplied for each method requested.

Method Blank

The method blank is a laboratory generated sample which assesses the degree to which laboratory operations cause a false positive. The target analytes in the analytical reports for a daily analytical batch are "B" flagged if their concentrations are present in the Method Blank above the RL, unless the result is greater then ten times the blank value..

Laboratory Control Spike

A laboratory control spike is a well characterized matrix similar to the sample which is spiked and run in duplicate with each Daily Analytical Batch. The laboratory control spike results are reported as a percent recovery. The QC Criteria for the control spike is listed in the Laboratory Control Report. Any results outside the control limits are flagged with a "Q" on the Laboratory Control Report. The control spike contains an abbreviated list of compounds in the method, and may contain compounds not on the target list for the specified report.

Laboratory Control Duplicate

The laboratory control duplicate is a duplicate analysis of the laboratory control spike, a standard, or a sample depending on the method. The results are reported as a relative percent difference (RPD). The criteria for the duplicate is in the Laboratory Control Report for the Daily Analytical Batch. Any results outside the control limits are flagged with a "Q" on the Laboratory Control Report.

Tentatively Identified Compounds are Identified by a Computer Match and Semi-Quantitated against an Internal Standard
1) The identity of the compound is determined by a match to a computer library.
2) Many compounds have similar mass spectra so the actual compound can be different from the one reported
3) Hydrocarbons especially have similar mass spectra so it is difficult to determine which hydrocarbon is present
4) If there is not a good computer match, a type of compound may be indicated or it may be called "Unknown"
5) The Amount of the compound is calculated against an Internal Standard, so the reported Amounts are approximate.
6) The conversion from ppbv to ug/m3 is done assuming an average molecular weight of 100 since the identity of the compound is often not known with certainty.

Tentatively Identified Compounds are Identified by a Computer Match and Semi-Quantitated against an Internal Standard
1) The identity of the compound is determined by a match to a computer library.
2) Many compounds have similar mass spectra so the actual compound can be different from the one reported
3) Hydrocarbons especially have similar mass spectra so it is difficult to determine which hydrocarbon is present
4) If there is not a good computer match, a type of compound may be indicated or it may be called "Unknown"
5) The Amount of the compound is calculated against an Internal Standard, so the reported Amounts are approximate.
6) The conversion from ppbv to ug/m3 is done assuming an average molecular weight of 100 since the identity of the compound is often not known with certainty.

Tentatively Identified Compounds are Identified by a Computer Match and Semi-Quantitated against an Internal Standard
1) The identity of the compound is determined by a match to a computer library.
2) Many compounds have similar mass spectra so the actual compound can be different from the one reported
3) Hydrocarbons especially have similar mass spectra so it is difficult to determine which hydrocarbon is present
4) If there is not a good computer match, a type of compound may be indicated or it may be called "Unknown"
5) The Amount of the compound is calculated against an Internal Standard, so the reported Amounts are approximate.
6) The conversion from ppbv to ug/m3 is done assuming an average molecular weight of 100 since the identity of the compound is often not known with certainty.

Tentatively Identified Compounds are Identified by a Computer Match and Semi-Quantitated against an Internal Standard
1) The identity of the compound is determined by a match to a computer library.
2) Many compounds have similar mass spectra so the actual compound can be different from the one reported
3) Hydrocarbons especially have similar mass spectra so it is difficult to determine which hydrocarbon is present
4) If there is not a good computer match, a type of compound may be indicated or it may be called "Unknown"
5) The Amount of the compound is calculated against an Internal Standard, so the reported Amounts are approximate.
6) The conversion from ppbv to ug/m3 is done assuming an average molecular weight of 100 since the identity of the compound is often not known with certainty.

Tentatively Identified Compounds are Identified by a Computer Match and Semi-Quantitated against an Internal Standard
1) The identity of the compound is determined by a match to a computer library.
2) Many compounds have similar mass spectra so the actual compound can be different from the one reported
3) Hydrocarbons especially have similar mass spectra so it is difficult to determine which hydrocarbon is present
4) If there is not a good computer match, a type of compound may be indicated or it may be called "Unknown"
5) The Amount of the compound is calculated against an Internal Standard, so the reported Amounts are approximate.
6) The conversion from ppbv to ug/m3 is done assuming an average molecular weight of 100 since the identity of the compound is often not known with certainty.

Tentatively Identified Compounds are Identified by a Computer Match and Semi-Quantitated against an Internal Standard
1) The identity of the compound is determined by a match to a computer library.
2) Many compounds have similar mass spectra so the actual compound can be different from the one reported
3) Hydrocarbons especially have similar mass spectra so it is difficult to determine which hydrocarbon is present
4) If there is not a good computer match, a type of compound may be indicated or it may be called "Unknown"
5) The Amount of the compound is calculated against an Internal Standard, so the reported Amounts are approximate.
6) The conversion from ppbv to ug/m3 is done assuming an average molecular weight of 100 since the identity of the compound is often not known with certainty.

Tentatively Identified Compounds are Identified by a Computer Match and Semi-Quantitated against an Internal Standard
1) The identity of the compound is determined by a match to a computer library.
2) Many compounds have similar mass spectra so the actual compound can be different from the one reported
3) Hydrocarbons especially have similar mass spectra so it is difficult to determine which hydrocarbon is present
4) If there is not a good computer match, a type of compound may be indicated or it may be called "Unknown"
5) The Amount of the compound is calculated against an Internal Standard, so the reported Amounts are approximate.
6) The conversion from ppbv to ug/m3 is done assuming an average molecular weight of 100 since the identity of the compound is often not known with certainty.

Tentatively Identified Compounds are Identified by a Computer Match and Semi-Quantitated against an Internal Standard
1) The identity of the compound is determined by a match to a computer library.
2) Many compounds have similar mass spectra so the actual compound can be different from the one reported
3) Hydrocarbons especially have similar mass spectra so it is difficult to determine which hydrocarbon is present
4) If there is not a good computer match, a type of compound may be indicated or it may be called "Unknown"
5) The Amount of the compound is calculated against an Internal Standard, so the reported Amounts are approximate.
6) The conversion from ppbv to ug/m3 is done assuming an average molecular weight of 100 since the identity of the compound is often not known with certainty.

Tentatively Identified Compounds are Identified by a Computer Match and Semi-Quantitated against an Internal Standard
1) The identity of the compound is determined by a match to a computer library.
2) Many compounds have similar mass spectra so the actual compound can be different from the one reported
3) Hydrocarbons especially have similar mass spectra so it is difficult to determine which hydrocarbon is present
4) If there is not a good computer match, a type of compound may be indicated or it may be called "Unknown"
5) The Amount of the compound is calculated against an Internal Standard, so the reported Amounts are approximate.
6) The conversion from ppbv to ug/m3 is done assuming an average molecular weight of 100 since the identity of the compound is often not known with certainty.

Analytical Reports

EAS SDG Number: 226144

Project Number: 17807

The following pages contain the certified Analytical Reports for the samples submitted in the Sample Delivery Group (SDG) and are in order of the EAS Lab ID number. All of the analytical methods used are modifications of the published methods. Procedural method modifications, QC modifications, QC Criteria modifications, target lists, definitions of detection limits, and flags are all explained in detail in the EAS Quality Manual. The Analytical Report has columns for the method detection limit (MDL), the reporting limit (RL), and the Amount. The Amount is the concentration of the compound in the sample. The report usually has the results reported with two commonly used units. The MDL, RL, and Amount are adjusted for the canister dilution factor and any dilution caused by sample matrix effects.

NELAC CERTIFICATION

EAS is accredited by the National Environmental Laboratory Accreditation (NELAC) with the Florida Department of Health, one of the NELAC certifying states. EAS is certified for the EPA TO-15, EPA TO-11 and EPA TO-4 methods. A list of accredited compounds is available on request.

DETECTION LIMITS

MDL: The MDL is lowest concentration that can be measured to be statistically above the noise level and is determined using the EPA 2016 method which uses the standard deviation of replicate measurements made over time. The method also incorporates systematic instrumentation blank levels. See Quality Manual for detailed explanation.

RL: The reporting limit (RL) is the lowest concentration that can be reliably reported for each compound that meets the QC Criteria for the method, background levels, or project specific considerations. The QC criteria level for the method blank is to be less then the RL See Quality Manual for more information.

DATA FLAGS

In the standard report, if a compound is not detected above the method detection limit, a "ND" is in the Amount column. The flag column is used for both the not detect flag and for any data flags.

B - This compound was detected in the batch method blank above the reporting limit and is greater then one tenth the amount in the sample.

E - This compound exceeds the calibration range for this sample volume.

J - The amount reported is estimated because it was below the RL and could be below the lowest calibration point, have higher uncertainty, or could be the result of system background

SIGNIFICANT FIGURES

Based on the uncertainty in the methods, the numbers on the Analytical Reports should be used with only two significant digits. Additional significant figures are reported for ease of use and to avoid rounding errors when used in further calculations.

UNITS

PPBV or PPMV: Parts-per-billion (or million) by volume is a mole (volume) ratio of the moles of analyte divided by the moles of air (gas). This is the primary unit used to report air or gas concentrations and is independent of temperature and pressure.

UG/M3 OR MG/M3: The reported result was calculated based on 1 atm pressure and a temperature of 25C. The conversion from PPBV is: UG/M3 = PPBV x MW/24.46 where 24.26 is the gas constant and MW is the Compounds Molecular Weight (sometimes called Formula Weight)

TIC Compound	MDL PPBV	RL PPBV	Amount PPBV	MDL UG/M3	RL UG/M3	Amount UG/M3
2-HEPTANONE, 6-METHYL-	7.00	15.00	18.30	28.67	61.43	74.95

Tentatively Identified Compounds are Identified by a Computer Match and Semi-Quantitated against an Internal Standard
1) The identity of the compound is determined by a match to a computer library.
2) Many compounds have similar mass spectra so the actual compound can be different from the one reported
3) Hydrocarbons especially have similar mass spectra so it is difficult to determine which hydrocarbon is present
4) If there is not a good computer match, a type of compound may be indicated or it may be called "Unknown"
5) The Amount of the compound is calculated against an Internal Standard, so the reported Amounts are approximate.
6) The conversion from ppbv to ug/m3 is done assuming an average molecular weight of 100 since the identity of the compound is often not known with certainty.

TIC Compound	MDL PPBV	RL PPBV	Amount PPBV	MDL UG/M3	RL UG/M3	Amount UG/M3
CYCLOHEXANONE, 3-METHYL	7.00	15.00	12.50	28.67	61.43	51.19
2-HEPTANONE, 6-METHYL-	7.00	15.00	24.50	28.67	61.43	100.34

Tentatively Identified Compounds are Identified by a Computer Match and Semi-Quantitated against an Internal Standard
1) The identity of the compound is determined by a match to a computer library.
2) Many compounds have similar mass spectra so the actual compound can be different from the one reported
3) Hydrocarbons especially have similar mass spectra so it is difficult to determine which hydrocarbon is present
4) If there is not a good computer match, a type of compound may be indicated or it may be called "Unknown"
5) The Amount of the compound is calculated against an Internal Standard, so the reported Amounts are approximate.
6) The conversion from ppbv to ug/m3 is done assuming an average molecular weight of 100 since the identity of the compound is often not known with certainty.

Tentatively Identified Compounds are Identified by a Computer Match and Semi-Quantitated against an Internal Standard
1) The identity of the compound is determined by a match to a computer library.
2) Many compounds have similar mass spectra so the actual compound can be different from the one reported
3) Hydrocarbons especially have similar mass spectra so it is difficult to determine which hydrocarbon is present
4) If there is not a good computer match, a type of compound may be indicated or it may be called "Unknown"
5) The Amount of the compound is calculated against an Internal Standard, so the reported Amounts are approximate.
6) The conversion from ppbv to ug/m3 is done assuming an average molecular weight of 100 since the identity of the compound is often not known with certainty.

Tentatively Identified Compounds are Identified by a Computer Match and Semi-Quantitated against an Internal Standard
1) The identity of the compound is determined by a match to a computer library.
2) Many compounds have similar mass spectra so the actual compound can be different from the one reported
3) Hydrocarbons especially have similar mass spectra so it is difficult to determine which hydrocarbon is present
4) If there is not a good computer match, a type of compound may be indicated or it may be called "Unknown"
5) The Amount of the compound is calculated against an Internal Standard, so the reported Amounts are approximate.
6) The conversion from ppbv to ug/m3 is done assuming an average molecular weight of 100 since the identity of the compound is often not known with certainty.

TIC Compound	MDL PPBV	RL PPBV	Amount PPBV	MDL UG/M3	RL UG/M3	Amount UG/M3
CYCLOPENTANE, METHYL-	7.00	15.00	18.40	28.67	61.43	75.36
BICYCLO[2.2.1]HEPT-2-ENE, 1,7,7-TRI	7.00	15.00	17.80	28.67	61.43	72.90

Tentatively Identified Compounds are Identified by a Computer Match and Semi-Quantitated against an Internal Standard
1) The identity of the compound is determined by a match to a computer library.
2) Many compounds have similar mass spectra so the actual compound can be different from the one reported
3) Hydrocarbons especially have similar mass spectra so it is difficult to determine which hydrocarbon is present
4) If there is not a good computer match, a type of compound may be indicated or it may be called "Unknown"
5) The Amount of the compound is calculated against an Internal Standard, so the reported Amounts are approximate.
6) The conversion from ppbv to ug/m3 is done assuming an average molecular weight of 100 since the identity of the compound is often not known with certainty.

Tentatively Identified Compounds are Identified by a Computer Match and Semi-Quantitated against an Internal Standard
1) The identity of the compound is determined by a match to a computer library.
2) Many compounds have similar mass spectra so the actual compound can be different from the one reported
3) Hydrocarbons especially have similar mass spectra so it is difficult to determine which hydrocarbon is present
4) If there is not a good computer match, a type of compound may be indicated or it may be called "Unknown"
5) The Amount of the compound is calculated against an Internal Standard, so the reported Amounts are approximate.
6) The conversion from ppbv to ug/m3 is done assuming an average molecular weight of 100 since the identity of the compound is often not known with certainty.

Tentatively Identified Compounds are Identified by a Computer Match and Semi-Quantitated against an Internal Standard
1) The identity of the compound is determined by a match to a computer library.
2) Many compounds have similar mass spectra so the actual compound can be different from the one reported
3) Hydrocarbons especially have similar mass spectra so it is difficult to determine which hydrocarbon is present
4) If there is not a good computer match, a type of compound may be indicated or it may be called "Unknown"
5) The Amount of the compound is calculated against an Internal Standard, so the reported Amounts are approximate.
6) The conversion from ppbv to ug/m3 is done assuming an average molecular weight of 100 since the identity of the compound is often not known with certainty.

Tentatively Identified Compounds are Identified by a Computer Match and Semi-Quantitated against an Internal Standard
1) The identity of the compound is determined by a match to a computer library.
2) Many compounds have similar mass spectra so the actual compound can be different from the one reported
3) Hydrocarbons especially have similar mass spectra so it is difficult to determine which hydrocarbon is present
4) If there is not a good computer match, a type of compound may be indicated or it may be called "Unknown"
5) The Amount of the compound is calculated against an Internal Standard, so the reported Amounts are approximate.
6) The conversion from ppbv to ug/m3 is done assuming an average molecular weight of 100 since the identity of the compound is often not known with certainty.

Tentatively Identified Compounds are Identified by a Computer Match and Semi-Quantitated against an Internal Standard
1) The identity of the compound is determined by a match to a computer library.
2) Many compounds have similar mass spectra so the actual compound can be different from the one reported
3) Hydrocarbons especially have similar mass spectra so it is difficult to determine which hydrocarbon is present
4) If there is not a good computer match, a type of compound may be indicated or it may be called "Unknown"
5) The Amount of the compound is calculated against an Internal Standard, so the reported Amounts are approximate.
6) The conversion from ppbv to ug/m3 is done assuming an average molecular weight of 100 since the identity of the compound is often not known with certainty.

Tentatively Identified Compounds are Identified by a Computer Match and Semi-Quantitated against an Internal Standard
1) The identity of the compound is determined by a match to a computer library.
2) Many compounds have similar mass spectra so the actual compound can be different from the one reported
3) Hydrocarbons especially have similar mass spectra so it is difficult to determine which hydrocarbon is present
4) If there is not a good computer match, a type of compound may be indicated or it may be called "Unknown"
5) The Amount of the compound is calculated against an Internal Standard, so the reported Amounts are approximate.
6) The conversion from ppbv to ug/m3 is done assuming an average molecular weight of 100 since the identity of the compound is often not known with certainty.

Tentatively Identified Compounds are Identified by a Computer Match and Semi-Quantitated against an Internal Standard
1) The identity of the compound is determined by a match to a computer library.
2) Many compounds have similar mass spectra so the actual compound can be different from the one reported
3) Hydrocarbons especially have similar mass spectra so it is difficult to determine which hydrocarbon is present
4) If there is not a good computer match, a type of compound may be indicated or it may be called "Unknown"
5) The Amount of the compound is calculated against an Internal Standard, so the reported Amounts are approximate.
6) The conversion from ppbv to ug/m3 is done assuming an average molecular weight of 100 since the identity of the compound is often not known with certainty.

Tentatively Identified Compounds are Identified by a Computer Match and Semi-Quantitated against an Internal Standard
1) The identity of the compound is determined by a match to a computer library.
2) Many compounds have similar mass spectra so the actual compound can be different from the one reported
3) Hydrocarbons especially have similar mass spectra so it is difficult to determine which hydrocarbon is present
4) If there is not a good computer match, a type of compound may be indicated or it may be called "Unknown"
5) The Amount of the compound is calculated against an Internal Standard, so the reported Amounts are approximate.
6) The conversion from ppbv to ug/m3 is done assuming an average molecular weight of 100 since the identity of the compound is often not known with certainty.

3',6-DIMETHOXYAURONE	7.00	15.00	45.80	28.67	61.43	187.57

Tentatively Identified Compounds are Identified by a Computer Match and Semi-Quantitated against an Internal Standard
1) The identity of the compound is determined by a match to a computer library.
2) Many compounds have similar mass spectra so the actual compound can be different from the one reported
3) Hydrocarbons especially have similar mass spectra so it is difficult to determine which hydrocarbon is present
4) If there is not a good computer match, a type of compound may be indicated or it may be called "Unknown"
5) The Amount of the compound is calculated against an Internal Standard, so the reported Amounts are approximate.
6) The conversion from ppbv to ug/m3 is done assuming an average molecular weight of 100 since the identity of the compound is often not known with certainty.

Tentatively Identified Compounds are Identified by a Computer Match and Semi-Quantitated against an Internal Standard
1) The identity of the compound is determined by a match to a computer library.
2) Many compounds have similar mass spectra so the actual compound can be different from the one reported
3) Hydrocarbons especially have similar mass spectra so it is difficult to determine which hydrocarbon is present
4) If there is not a good computer match, a type of compound may be indicated or it may be called "Unknown"
5) The Amount of the compound is calculated against an Internal Standard, so the reported Amounts are approximate.
6) The conversion from ppbv to ug/m3 is done assuming an average molecular weight of 100 since the identity of the compound is often not known with certainty.

Tentatively Identified Compounds are Identified by a Computer Match and Semi-Quantitated against an Internal Standard
1) The identity of the compound is determined by a match to a computer library.
2) Many compounds have similar mass spectra so the actual compound can be different from the one reported
3) Hydrocarbons especially have similar mass spectra so it is difficult to determine which hydrocarbon is present
4) If there is not a good computer match, a type of compound may be indicated or it may be called "Unknown"
5) The Amount of the compound is calculated against an Internal Standard, so the reported Amounts are approximate.
6) The conversion from ppbv to ug/m3 is done assuming an average molecular weight of 100 since the identity of the compound is often not known with certainty.

Tentatively Identified Compounds are Identified by a Computer Match and Semi-Quantitated against an Internal Standard
1) The identity of the compound is determined by a match to a computer library.
2) Many compounds have similar mass spectra so the actual compound can be different from the one reported
3) Hydrocarbons especially have similar mass spectra so it is difficult to determine which hydrocarbon is present
4) If there is not a good computer match, a type of compound may be indicated or it may be called "Unknown"
5) The Amount of the compound is calculated against an Internal Standard, so the reported Amounts are approximate.
6) The conversion from ppbv to ug/m3 is done assuming an average molecular weight of 100 since the identity of the compound is often not known with certainty.

Tentatively Identified Compounds are Identified by a Computer Match and Semi-Quantitated against an Internal Standard
1) The identity of the compound is determined by a match to a computer library.
2) Many compounds have similar mass spectra so the actual compound can be different from the one reported
3) Hydrocarbons especially have similar mass spectra so it is difficult to determine which hydrocarbon is present
4) If there is not a good computer match, a type of compound may be indicated or it may be called "Unknown"
5) The Amount of the compound is calculated against an Internal Standard, so the reported Amounts are approximate.
6) The conversion from ppbv to ug/m3 is done assuming an average molecular weight of 100 since the identity of the compound is often not known with certainty.

Tentatively Identified Compounds are Identified by a Computer Match and Semi-Quantitated against an Internal Standard
1) The identity of the compound is determined by a match to a computer library.
2) Many compounds have similar mass spectra so the actual compound can be different from the one reported
3) Hydrocarbons especially have similar mass spectra so it is difficult to determine which hydrocarbon is present
4) If there is not a good computer match, a type of compound may be indicated or it may be called "Unknown"
5) The Amount of the compound is calculated against an Internal Standard, so the reported Amounts are approximate.
6) The conversion from ppbv to ug/m3 is done assuming an average molecular weight of 100 since the identity of the compound is often not known with certainty.

Tentatively Identified Compounds are Identified by a Computer Match and Semi-Quantitated against an Internal Standard
1) The identity of the compound is determined by a match to a computer library.
2) Many compounds have similar mass spectra so the actual compound can be different from the one reported
3) Hydrocarbons especially have similar mass spectra so it is difficult to determine which hydrocarbon is present
4) If there is not a good computer match, a type of compound may be indicated or it may be called "Unknown"
5) The Amount of the compound is calculated against an Internal Standard, so the reported Amounts are approximate.
6) The conversion from ppbv to ug/m3 is done assuming an average molecular weight of 100 since the identity of the compound is often not known with certainty.

Tentatively Identified Compounds are Identified by a Computer Match and Semi-Quantitated against an Internal Standard

1) The identity of the compound is determined by a match to a computer library.
2) Many compounds have similar mass spectra so the actual compound can be different from the one reported
3) Hydrocarbons especially have similar mass spectra so it is difficult to determine which hydrocarbon is present
4) If there is not a good computer match, a type of compound may be indicated or it may be called "Unknown"
5) The Amount of the compound is calculated against an Internal Standard, so the reported Amounts are approximate.
6) The conversion from ppbv to ug/m3 is done assuming an average molecular weight of 100 since the identity of the compound is often not known with certainty.

Tentatively Identified Compounds are Identified by a Computer Match and Semi-Quantitated against an Internal Standard
1) The identity of the compound is determined by a match to a computer library.
2) Many compounds have similar mass spectra so the actual compound can be different from the one reported
3) Hydrocarbons especially have similar mass spectra so it is difficult to determine which hydrocarbon is present
4) If there is not a good computer match, a type of compound may be indicated or it may be called "Unknown"
5) The Amount of the compound is calculated against an Internal Standard, so the reported Amounts are approximate.
6) The conversion from ppbv to ug/m3 is done assuming an average molecular weight of 100 since the identity of the compound is often not known with certainty.

Tentatively Identified Compounds are Identified by a Computer Match and Semi-Quantitated against an Internal Standard
1) The identity of the compound is determined by a match to a computer library.
2) Many compounds have similar mass spectra so the actual compound can be different from the one reported
3) Hydrocarbons especially have similar mass spectra so it is difficult to determine which hydrocarbon is present
4) If there is not a good computer match, a type of compound may be indicated or it may be called "Unknown"
5) The Amount of the compound is calculated against an Internal Standard, so the reported Amounts are approximate.
6) The conversion from ppbv to ug/m3 is done assuming an average molecular weight of 100 since the identity of the compound is often not known with certainty.

Tentatively Identified Compounds are Identified by a Computer Match and Semi-Quantitated against an Internal Standard
1) The identity of the compound is determined by a match to a computer library.
2) Many compounds have similar mass spectra so the actual compound can be different from the one reported
3) Hydrocarbons especially have similar mass spectra so it is difficult to determine which hydrocarbon is present
4) If there is not a good computer match, a type of compound may be indicated or it may be called "Unknown"
5) The Amount of the compound is calculated against an Internal Standard, so the reported Amounts are approximate.
6) The conversion from ppbv to ug/m3 is done assuming an average molecular weight of 100 since the identity of the compound is often not known with certainty.

Tentatively Identified Compounds are Identified by a Computer Match and Semi-Quantitated against an Internal Standard
1) The identity of the compound is determined by a match to a computer library.
2) Many compounds have similar mass spectra so the actual compound can be different from the one reported
3) Hydrocarbons especially have similar mass spectra so it is difficult to determine which hydrocarbon is present
4) If there is not a good computer match, a type of compound may be indicated or it may be called "Unknown"
5) The Amount of the compound is calculated against an Internal Standard, so the reported Amounts are approximate.
6) The conversion from ppbv to ug/m3 is done assuming an average molecular weight of 100 since the identity of the compound is often not known with certainty.

1-HEXANOL, 2-ETHYL-	7.00	15.00	19.50	28.67	61.43	79.86

Tentatively Identified Compounds are Identified by a Computer Match and Semi-Quantitated against an Internal Standard
1) The identity of the compound is determined by a match to a computer library.
2) Many compounds have similar mass spectra so the actual compound can be different from the one reported
3) Hydrocarbons especially have similar mass spectra so it is difficult to determine which hydrocarbon is present
4) If there is not a good computer match, a type of compound may be indicated or it may be called "Unknown"
5) The Amount of the compound is calculated against an Internal Standard, so the reported Amounts are approximate.
6) The conversion from ppbv to ug/m3 is done assuming an average molecular weight of 100 since the identity of the compound is often not known with certainty.

Tentatively Identified Compounds are Identified by a Computer Match and Semi-Quantitated against an Internal Standard

1) The identity of the compound is determined by a match to a computer library.
2) Many compounds have similar mass spectra so the actual compound can be different from the one reported
3) Hydrocarbons especially have similar mass spectra so it is difficult to determine which hydrocarbon is present
4) If there is not a good computer match, a type of compound may be indicated or it may be called "Unknown"
5) The Amount of the compound is calculated against an Internal Standard, so the reported Amounts are approximate.
6) The conversion from ppbv to ug/m3 is done assuming an average molecular weight of 100 since the identity of the compound is often not known with certainty.

Tentatively Identified Compounds are Identified by a Computer Match and Semi-Quantitated against an Internal Standard
1) The identity of the compound is determined by a match to a computer library.
2) Many compounds have similar mass spectra so the actual compound can be different from the one reported
3) Hydrocarbons especially have similar mass spectra so it is difficult to determine which hydrocarbon is present
4) If there is not a good computer match, a type of compound may be indicated or it may be called "Unknown"
5) The Amount of the compound is calculated against an Internal Standard, so the reported Amounts are approximate.
6) The conversion from ppbv to ug/m3 is done assuming an average molecular weight of 100 since the identity of the compound is often not known with certainty.

Tentatively Identified Compounds are Identified by a Computer Match and Semi-Quantitated against an Internal Standard
1) The identity of the compound is determined by a match to a computer library.
2) Many compounds have similar mass spectra so the actual compound can be different from the one reported
3) Hydrocarbons especially have similar mass spectra so it is difficult to determine which hydrocarbon is present
4) If there is not a good computer match, a type of compound may be indicated or it may be called "Unknown"
5) The Amount of the compound is calculated against an Internal Standard, so the reported Amounts are approximate.
6) The conversion from ppbv to ug/m3 is done assuming an average molecular weight of 100 since the identity of the compound is often not known with certainty.

Tentatively Identified Compounds are Identified by a Computer Match and Semi-Quantitated against an Internal Standard
1) The identity of the compound is determined by a match to a computer library.
2) Many compounds have similar mass spectra so the actual compound can be different from the one reported
3) Hydrocarbons especially have similar mass spectra so it is difficult to determine which hydrocarbon is present
4) If there is not a good computer match, a type of compound may be indicated or it may be called "Unknown"
5) The Amount of the compound is calculated against an Internal Standard, so the reported Amounts are approximate.
6) The conversion from ppbv to ug/m3 is done assuming an average molecular weight of 100 since the identity of the compound is often not known with certainty.

Tentatively Identified Compounds are Identified by a Computer Match and Semi-Quantitated against an Internal Standard
1) The identity of the compound is determined by a match to a computer library.
2) Many compounds have similar mass spectra so the actual compound can be different from the one reported
3) Hydrocarbons especially have similar mass spectra so it is difficult to determine which hydrocarbon is present
4) If there is not a good computer match, a type of compound may be indicated or it may be called "Unknown"
5) The Amount of the compound is calculated against an Internal Standard, so the reported Amounts are approximate.
6) The conversion from ppbv to ug/m3 is done assuming an average molecular weight of 100 since the identity of the compound is often not known with certainty.

TIC Compound	MDL PPBV	RL PPBV	Amount PPBV	MDL UG/M3	RL UG/M3	Amount UG/M3
1 PROPANE, 2-METHYL-	7.00	15.00	15.60	28.67	61.43	63.89
BUTANE	7.00	15.00	14.10	28.67	61.43	57.75

Tentatively Identified Compounds are Identified by a Computer Match and Semi-Quantitated against an Internal Standard
1) The identity of the compound is determined by a match to a computer library.
2) Many compounds have similar mass spectra so the actual compound can be different from the one reported
3) Hydrocarbons especially have similar mass spectra so it is difficult to determine which hydrocarbon is present
4) If there is not a good computer match, a type of compound may be indicated or it may be called "Unknown"
5) The Amount of the compound is calculated against an Internal Standard, so the reported Amounts are approximate.
6) The conversion from ppbv to ug/m3 is done assuming an average molecular weight of 100 since the identity of the compound is often not known with certainty.

Tentatively Identified Compounds are Identified by a Computer Match and Semi-Quantitated against an Internal Standard
1) The identity of the compound is determined by a match to a computer library.
2) Many compounds have similar mass spectra so the actual compound can be different from the one reported
3) Hydrocarbons especially have similar mass spectra so it is difficult to determine which hydrocarbon is present
4) If there is not a good computer match, a type of compound may be indicated or it may be called "Unknown"
5) The Amount of the compound is calculated against an Internal Standard, so the reported Amounts are approximate.
6) The conversion from ppbv to ug/m3 is done assuming an average molecular weight of 100 since the identity of the compound is often not known with certainty.

Tentatively Identified Compounds are Identified by a Computer Match and Semi-Quantitated against an Internal Standard
1) The identity of the compound is determined by a match to a computer library.
2) Many compounds have similar mass spectra so the actual compound can be different from the one reported
3) Hydrocarbons especially have similar mass spectra so it is difficult to determine which hydrocarbon is present
4) If there is not a good computer match, a type of compound may be indicated or it may be called "Unknown"
5) The Amount of the compound is calculated against an Internal Standard, so the reported Amounts are approximate.
6) The conversion from ppbv to ug/m3 is done assuming an average molecular weight of 100 since the identity of the compound is often not known with certainty.

Tentatively Identified Compounds are Identified by a Computer Match and Semi-Quantitated against an Internal Standard
1) The identity of the compound is determined by a match to a computer library.
2) Many compounds have similar mass spectra so the actual compound can be different from the one reported
3) Hydrocarbons especially have similar mass spectra so it is difficult to determine which hydrocarbon is present
4) If there is not a good computer match, a type of compound may be indicated or it may be called "Unknown"
5) The Amount of the compound is calculated against an Internal Standard, so the reported Amounts are approximate.
6) The conversion from ppbv to ug/m3 is done assuming an average molecular weight of 100 since the identity of the compound is often not known with certainty.

Tentatively Identified Compounds are Identified by a Computer Match and Semi-Quantitated against an Internal Standard
1) The identity of the compound is determined by a match to a computer library.
2) Many compounds have similar mass spectra so the actual compound can be different from the one reported
3) Hydrocarbons especially have similar mass spectra so it is difficult to determine which hydrocarbon is present
4) If there is not a good computer match, a type of compound may be indicated or it may be called "Unknown"
5) The Amount of the compound is calculated against an Internal Standard, so the reported Amounts are approximate.
6) The conversion from ppbv to ug/m3 is done assuming an average molecular weight of 100 since the identity of the compound is often not known with certainty.

Tentatively Identified Compounds are Identified by a Computer Match and Semi-Quantitated against an Internal Standard
1) The identity of the compound is determined by a match to a computer library.
2) Many compounds have similar mass spectra so the actual compound can be different from the one reported
3) Hydrocarbons especially have similar mass spectra so it is difficult to determine which hydrocarbon is present
4) If there is not a good computer match, a type of compound may be indicated or it may be called "Unknown"
5) The Amount of the compound is calculated against an Internal Standard, so the reported Amounts are approximate.
6) The conversion from ppbv to ug/m3 is done assuming an average molecular weight of 100 since the identity of the compound is often not known with certainty.

Air Volume: 100.00 ml

TIC Compound	MDL PPBV	RL PPBV	Amount PPBV	MDL UG/M3	RL UG/M3	Amount UG/M3
2-HEPTANONE, 6-METHYL-	7.00	15.00	17.00	28.67	61.43	69.62
1-DECANE, 3,4-DIMETHYL	7.00	15.00	20.40	28.67	61.43	83.55

Tentatively Identified Compounds are Identified by a Computer Match and Semi-Quantitated against an Internal Standard
1) The identity of the compound is determined by a match to a computer library.
2) Many compounds have similar mass spectra so the actual compound can be different from the one reported
3) Hydrocarbons especially have similar mass spectra so it is difficult to determine which hydrocarbon is present
4) If there is not a good computer match, a type of compound may be indicated or it may be called "Unknown"
5) The Amount of the compound is calculated against an Internal Standard, so the reported Amounts are approximate.
6) The conversion from ppbv to ug/m3 is done assuming an average molecular weight of 100 since the identity of the compound is often not known with certainty.

TIC Compound	MDL PPBV	RL PPBV	Amount PPBV	MDL UG/M3	RL UG/M3	Amount UG/M3
2-HEPTANONE	7.00	15.00	79.80	28.67	61.43	326.82
2-OCTANONE	7.00	15.00	41.90	28.67	61.43	171.60

Tentatively Identified Compounds are Identified by a Computer Match and Semi-Quantitated against an Internal Standard
1) The identity of the compound is determined by a match to a computer library.
2) Many compounds have similar mass spectra so the actual compound can be different from the one reported
3) Hydrocarbons especially have similar mass spectra so it is difficult to determine which hydrocarbon is present
4) If there is not a good computer match, a type of compound may be indicated or it may be called "Unknown"
5) The Amount of the compound is calculated against an Internal Standard, so the reported Amounts are approximate.
6) The conversion from ppbv to ug/m3 is done assuming an average molecular weight of 100 since the identity of the compound is often not known with certainty.

Tentatively Identified Compounds are Identified by a Computer Match and Semi-Quantitated against an Internal Standard

1) The identity of the compound is determined by a match to a computer library.
2) Many compounds have similar mass spectra so the actual compound can be different from the one reported
3) Hydrocarbons especially have similar mass spectra so it is difficult to determine which hydrocarbon is present
4) If there is not a good computer match, a type of compound may be indicated or it may be called "Unknown"
5) The Amount of the compound is calculated against an Internal Standard, so the reported Amounts are approximate.
6) The conversion from ppbv to ug/m3 is done assuming an average molecular weight of 100 since the identity of the compound is often not known with certainty.

Tentatively Identified Compounds are Identified by a Computer Match and Semi-Quantitated against an Internal Standard
1) The identity of the compound is determined by a match to a computer library.
2) Many compounds have similar mass spectra so the actual compound can be different from the one reported
3) Hydrocarbons especially have similar mass spectra so it is difficult to determine which hydrocarbon is present
4) If there is not a good computer match, a type of compound may be indicated or it may be called "Unknown"
5) The Amount of the compound is calculated against an Internal Standard, so the reported Amounts are approximate.
6) The conversion from ppbv to ug/m3 is done assuming an average molecular weight of 100 since the identity of the compound is often not known with certainty.

Tentatively Identified Compounds are Identified by a Computer Match and Semi-Quantitated against an Internal Standard
1) The identity of the compound is determined by a match to a computer library.
2) Many compounds have similar mass spectra so the actual compound can be different from the one reported
3) Hydrocarbons especially have similar mass spectra so it is difficult to determine which hydrocarbon is present
4) If there is not a good computer match, a type of compound may be indicated or it may be called "Unknown"
5) The Amount of the compound is calculated against an Internal Standard, so the reported Amounts are approximate.
6) The conversion from ppbv to ug/m3 is done assuming an average molecular weight of 100 since the identity of the compound is often not known with certainty.

Tentatively Identified Compounds are Identified by a Computer Match and Semi-Quantitated against an Internal Standard
1) The identity of the compound is determined by a match to a computer library.
2) Many compounds have similar mass spectra so the actual compound can be different from the one reported
3) Hydrocarbons especially have similar mass spectra so it is difficult to determine which hydrocarbon is present
4) If there is not a good computer match, a type of compound may be indicated or it may be called "Unknown"
5) The Amount of the compound is calculated against an Internal Standard, so the reported Amounts are approximate.
6) The conversion from ppbv to ug/m3 is done assuming an average molecular weight of 100 since the identity of the compound is often not known with certainty.

Tentatively Identified Compounds are Identified by a Computer Match and Semi-Quantitated against an Internal Standard
1) The identity of the compound is determined by a match to a computer library.
2) Many compounds have similar mass spectra so the actual compound can be different from the one reported
3) Hydrocarbons especially have similar mass spectra so it is difficult to determine which hydrocarbon is present
4) If there is not a good computer match, a type of compound may be indicated or it may be called "Unknown"
5) The Amount of the compound is calculated against an Internal Standard, so the reported Amounts are approximate.
6) The conversion from ppbv to ug/m3 is done assuming an average molecular weight of 100 since the identity of the compound is often not known with certainty.

Tentatively Identified Compounds are Identified by a Computer Match and Semi-Quantitated against an Internal Standard
1) The identity of the compound is determined by a match to a computer library.
2) Many compounds have similar mass spectra so the actual compound can be different from the one reported
3) Hydrocarbons especially have similar mass spectra so it is difficult to determine which hydrocarbon is present
4) If there is not a good computer match, a type of compound may be indicated or it may be called "Unknown"
5) The Amount of the compound is calculated against an Internal Standard, so the reported Amounts are approximate.
6) The conversion from ppbv to ug/m3 is done assuming an average molecular weight of 100 since the identity of the compound is often not known with certainty.

TIC Compound	MDL PPBV	RL PPBV	Amount PPBV	MDL UG/M3	RL UG/M3	Amount UG/M3
1-DECENE, 3,4-DIMETHYL	7.00	15.00	15.00	28.67	61.43	61.43

Tentatively Identified Compounds are Identified by a Computer Match and Semi-Quantitated against an Internal Standard
1) The identity of the compound is determined by a match to a computer library.
2) Many compounds have similar mass spectra so the actual compound can be different from the one reported
3) Hydrocarbons especially have similar mass spectra so it is difficult to determine which hydrocarbon is present
4) If there is not a good computer match, a type of compound may be indicated or it may be called "Unknown"
5) The Amount of the compound is calculated against an Internal Standard, so the reported Amounts are approximate.
6) The conversion from ppbv to ug/m3 is done assuming an average molecular weight of 100 since the identity of the compound is often not known with certainty.

1-HEXANOL, 2-ETHYL	7.00	15.00	13.70	28.67	61.43	56.11

Tentatively Identified Compounds are Identified by a Computer Match and Semi-Quantitated against an Internal Standard
1) The identity of the compound is determined by a match to a computer library.
2) Many compounds have similar mass spectra so the actual compound can be different from the one reported
3) Hydrocarbons especially have similar mass spectra so it is difficult to determine which hydrocarbon is present
4) If there is not a good computer match, a type of compound may be indicated or it may be called "Unknown"
5) The Amount of the compound is calculated against an Internal Standard, so the reported Amounts are approximate.
6) The conversion from ppbv to ug/m3 is done assuming an average molecular weight of 100 since the identity of the compound is often not known with certainty.

Tentatively Identified Compounds are Identified by a Computer Match and Semi-Quantitated against an Internal Standard
1) The identity of the compound is determined by a match to a computer library.
2) Many compounds have similar mass spectra so the actual compound can be different from the one reported
3) Hydrocarbons especially have similar mass spectra so it is difficult to determine which hydrocarbon is present
4) If there is not a good computer match, a type of compound may be indicated or it may be called "Unknown"
5) The Amount of the compound is calculated against an Internal Standard, so the reported Amounts are approximate.
6) The conversion from ppbv to ug/m3 is done assuming an average molecular weight of 100 since the identity of the compound is often not known with certainty.

Tentatively Identified Compounds are Identified by a Computer Match and Semi-Quantitated against an Internal Standard
1) The identity of the compound is determined by a match to a computer library.
2) Many compounds have similar mass spectra so the actual compound can be different from the one reported
3) Hydrocarbons especially have similar mass spectra so it is difficult to determine which hydrocarbon is present
4) If there is not a good computer match, a type of compound may be indicated or it may be called "Unknown"
5) The Amount of the compound is calculated against an Internal Standard, so the reported Amounts are approximate.
6) The conversion from ppbv to ug/m3 is done assuming an average molecular weight of 100 since the identity of the compound is often not known with certainty.

Tentatively Identified Compounds are Identified by a Computer Match and Semi-Quantitated against an Internal Standard
1) The identity of the compound is determined by a match to a computer library.
2) Many compounds have similar mass spectra so the actual compound can be different from the one reported
3) Hydrocarbons especially have similar mass spectra so it is difficult to determine which hydrocarbon is present
4) If there is not a good computer match, a type of compound may be indicated or it may be called "Unknown"
5) The Amount of the compound is calculated against an Internal Standard, so the reported Amounts are approximate.
6) The conversion from ppbv to ug/m3 is done assuming an average molecular weight of 100 since the identity of the compound is often not known with certainty.

Tentatively Identified Compounds are Identified by a Computer Match and Semi-Quantitated against an Internal Standard
1) The identity of the compound is determined by a match to a computer library.
2) Many compounds have similar mass spectra so the actual compound can be different from the one reported
3) Hydrocarbons especially have similar mass spectra so it is difficult to determine which hydrocarbon is present
4) If there is not a good computer match, a type of compound may be indicated or it may be called "Unknown"
5) The Amount of the compound is calculated against an Internal Standard, so the reported Amounts are approximate.
6) The conversion from ppbv to ug/m3 is done assuming an average molecular weight of 100 since the identity of the compound is often not known with certainty.

Tentatively Identified Compounds are Identified by a Computer Match and Semi-Quantitated against an Internal Standard

1) The identity of the compound is determined by a match to a computer library.
2) Many compounds have similar mass spectra so the actual compound can be different from the one reported
3) Hydrocarbons especially have similar mass spectra so it is difficult to determine which hydrocarbon is present
4) If there is not a good computer match, a type of compound may be indicated or it may be called "Unknown"
5) The Amount of the compound is calculated against an Internal Standard, so the reported Amounts are approximate.
6) The conversion from ppbv to ug/m3 is done assuming an average molecular weight of 100 since the identity of the compound is often not known with certainty.

Tentatively Identified Compounds are Identified by a Computer Match and Semi-Quantitated against an Internal Standard
1) The identity of the compound is determined by a match to a computer library.
2) Many compounds have similar mass spectra so the actual compound can be different from the one reported
3) Hydrocarbons especially have similar mass spectra so it is difficult to determine which hydrocarbon is present
4) If there is not a good computer match, a type of compound may be indicated or it may be called "Unknown"
5) The Amount of the compound is calculated against an Internal Standard, so the reported Amounts are approximate.
6) The conversion from ppbv to ug/m3 is done assuming an average molecular weight of 100 since the identity of the compound is often not known with certainty.

Analytical Report

Project Name:

Chiquita Canyon

EAS SDG Number: **226144**

Client Project Manager: Chuck Schmidt

Prepared For:
C.E. Schmidt
19200 Live Oak Road
Red Bluff CA 96080

Project Number: 17807
Sample Event Date: 7/20-7/24/2026
Received Date: 7/24/2026
Report Date: 9/3/2026

Project Number:
PO Number:

This is the Laboratory Report for the samples in the indicated Sample Delivery Group (SDG). Each sample received in the group is assigned a Laboratory ID number. The combination of the SDG number and the Lab ID number is an unique identifier for the sample.

This Report Contains:

Laboratory Work Order
Project Sample Media
Laboratory Case Narrative and Chain of Custody
Method Description (when applicable)
Quality Control Reports
Analytical Reports

NELAC Certification: Florida E871125

173 Cross Street, San Luis Obispo, CA 93401 (805) 781-3585

Project Sample Media

SDG Number: 226144

The following sample media was used for this Sample Delivery Group (SDG). The Sample Media column identifies the type of media. For canisters, the Sample Media Batch gives the canister number followed by the cleaning batch number, which is a unique identification. The initial pressure of the canister when it is received is recorded. If the canister is not pressurized, the final pressure will be the same as the initial pressure. If the canister is pessurized the final pressure will be recorded, and the canister dilution factor is calculated as the ratio of the final to initial pressure. The results are adjusted for the can dilution factor.

SDG	Lab ID	Client Sample No.	Sample Media	Batch	Pressure, torr Initial	Pressure, torr Final	Can Factor

Laboratory Case Narrative

EAS SDG Number: 226144 **Project Number:** 17807

Client: C.E. Schmidt

The Laboratory Case Narrative for the SDG is below. The Chain of Custody form(s) follow the Laboratory Case Narrative.

Sample Control Narrative

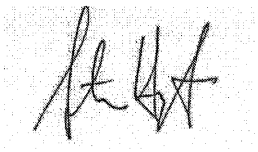
The samples were all received in good condition and with proper preservation.

Analytical Methods

The methods used for sample analysis are listed on the Analytyical Report header, and have been modified as described in the EAS Quality Manual..

Case Narrative

QC Narrative



All analyses met EAS method criteria as defined in the Quality Manual, except as noted in the report or QC reports with data qualifiers.

Subcontract Narrative

No sample analysis was subcontracted for this project

Laboratory Certification

I certify that this data package is in compliance with the terms and conditions of the contract, both technically and for completeness other than the condition(s) noted above. The Laboratory Report is property of EAS and its client. The entire report has been reviewed and approved.

Date Approved: 9/3/2026

Environmental Analytical Service
Laboratory Director

Quality Control Report

EAS SDG Number: 226144

Project Number: 17807

QC Narrative

Samples were anlayzed in a daily analytical batch (DAB) designated by a QC batch number, and were analyzed using EAS standard laboratory QC specified in the EAS Quality Manual which may be different then the referrenced agency method. Any deviations from the EAS QC criteria are flagged in the Laboratory Control Reports or in the sample Analytical Reports.

Standard Laboratory QC Report

Unless project specific QC was requested, this Section containing the standard laboratory QC (Level 2) supplied with the Analytical Reports. Each sample is analyzed in a Daily Analytical Batch (DAB) which includes the method blank, a laboratory control spike (LCS) and a laboratory control duplicate (LCD). A Daily Analytical Batch QC report is supplied for each method requested.

Method Blank

The method blank is a laboratory generated sample which assesses the degree to which laboratory operations cause a false positive. The target analytes in the analytical reports for a daily analytical batch are "B" flagged if their concentrations are present in the Method Blank above the RL, unless the result is greater then ten times the blank value..

Laboratory Control Spike

A laboratory control spike is a well characterized matrix similar to the sample which is spiked and run in duplicate with each Daily Analytical Batch. The laboratory control spike results are reported as a percent recovery. The QC Criteria for the control spike is listed in the Laboratory Control Report. Any results outside the control limits are flagged with a "Q" on the Laboratory Control Report. The control spike contains an abbreviated list of compounds in the method, and may contain compounds not on the target list for the specified report.

Laboratory Control Duplicate

The laboratory control duplicate is a duplicate analysis of the laboratory control spike, a standard, or a sample depending on the method. The results are reported as a relative percent difference (RPD). The criteria for the duplicate is in the Laboratory Control Report for the Daily Analytical Batch. Any results outside the control limits are flagged with a "Q" on the Laboratory Control Report.

Analytical Reports

EAS SDG Number: 226144

Project Number: 17807

The following pages contain the certified Analytical Reports for the samples submitted in the Sample Delivery Group (SDG) and are in order of the EAS Lab ID number. All of the analytical methods used are modifications of the published methods. Procedural method modifications, QC modifications, QC Criteria modifications, target lists, definitions of detection limits, and flags are all explained in detail in the EAS Quality Manual. The Analytical Report has columns for the method detection limit (MDL), the reporting limit (RL), and the Amount. The Amount is the concentration of the compound in the sample. The report usually has the results reported with two commonly used units. The MDL, RL, and Amount are adjusted for the canister dilution factor and any dilution caused by sample matrix effects.

NELAC CERTIFICATION

EAS is accredited by the National Environmental Laboratory Accreditation (NELAC) with the Florida Department of Health, one of the NELAC certifying states. EAS is certified for the EPA TO-15, EPA TO-11 and EPA TO-4 methods. A list of accredited compounds is available on request.

DETECTION LIMITS

MDL: The MDL is lowest concentration that can be measured to be statistically above the noise level and is determined using the EPA 2016 method which uses the standard deviation of replicate measurements made over time. The method also incorporates systematic instrumentation blank levels. See Quality Manual for detailed explanation.

RL: The reporting limit (RL) is the lowest concentration that can be reliably reported for each compound that meets the QC Criteria for the method, background levels, or project specific considerations. The QC criteria level for the method blank is to be less then the RL See Quality Manual for more information.

DATA FLAGS

In the standard report, if a compound is not detected above the method detection limit, a "ND" is in the Amount column. The flag column is used for both the not detect flag and for any data flags.

B - This compound was detected in the batch method blank above the reporting limit and is greater then one tenth the amount in the sample.

E - This compound exceeds the calibration range for this sample volume.

J - The amount reported is estimated because it was below the RL and could be below the lowest calibration point, have higher uncertainty, or could be the result of system background

SIGNIFICANT FIGURES

Based on the uncertainty in the methods, the numbers on the Analytical Reports should be used with only two significant digits. Additional significant figures are reported for ease of use and to avoid rounding errors when used in further calculations.

UNITS

PPBV or PPMV: Parts-per-billion (or million) by volume is a mole (volume) ratio of the moles of analyte divided by the moles of air (gas). This is the primary unit used to report air or gas concentrations and is independent of temperature and pressure.

UG/M3 OR MG/M3: The reported result was calculated based on 1 atm pressure and a temperature of 25C. The conversion from PPBV is: UG/M3 = PPBV x MW/24.46 where 24.26 is the gas constant and MW is the Compounds Molecular Weight (sometimes called Formula Weight)

ANALYTICAL REPORT

ENVIRONMENTAL
Analytical Service, Inc.

EPA Method TO-14 FID

Analytical Method: TO-14FID

SDG: 226144
Laboratory Number: 70

File Name: 2614470A
Description: T-514
Canister: 775
QC_Batch: 080326-GCK

Date Sampled: 07/24/26 **Time:** 12:05
Date Analyzed: 08/03/2026 **Time:** 13:13
Can Factor: 1.00
Air Volume: 200 ml

Analytical Report

Project Name:

Chiquita Canyon

EAS SDG Number: **226144**

Client Project Manager: Chuck Schmidt

Prepared For:
C.E. Schmidt
19200 Live Oak Road
Red Bluff CA 96080

Project Number: 17807
Sample Event Date: 7/20-7/24/2026
Received Date: 7/24/2026
Report Date: 9/3/2026

Project Number:
PO Number:

This is the Laboratory Report for the samples in the indicated Sample Delivery Group (SDG). Each sample received in the group is assigned a Laboratory ID number. The combination of the SDG number and the Lab ID number is an unique identifier for the sample.

This Report Contains:

Laboratory Work Order
Project Sample Media
Laboratory Case Narrative and Chain of Custody
Method Description (when applicable)
Quality Control Reports
Analytical Reports

NELAC Certification: Florida E871125

173 Cross Street, San Luis Obispo, CA 93401 (805) 781-3585

Laboratory Work Order

SDG Number: 226144
Client: Chuck Schmidt
C.E. Schmidt

Project Number: 17807
Received: 7/24/2026

SAMPLE DESCRIPTION AND ANALYSIS REQUESTED

Project Sample Media

SDG Number: 226144

The following sample media was used for this Sample Delivery Group (SDG). The Sample Media column identifies the type of media. For canisters, the Sample Media Batch gives the canister number followed by the cleaning batch number, which is a unique identification. The initial pressure of the canister when it is received is recorded. If the canister is not pressurized, the final pressure will be the same as the initial pressure. If the canister is pessurized the final pressure will be recorded, and the canister dilution factor is calculated as the ratio of the final to initial pressure. The results are adjusted for the can dilution factor.

SDG	Lab ID	Client Sample No.	Sample Media	Batch	Pressure, torr Initial	Final	Can Factor

Laboratory Case Narrative

EAS SDG Number: 226144 **Project Number:** 17807

Client: C.E. Schmidt

The Laboratory Case Narrative for the SDG is below. The Chain of Custody form(s) follow the Laboratory Case Narrative.

Sample Control Narrative

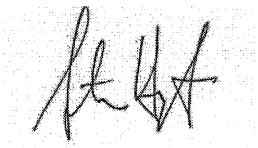
The samples were all received in good condition and with proper preservation.

Analytical Methods

The methods used for sample analysis are listed on the Analytyical Report header, and have been modified as described in the EAS Quality Manual..

Case Narrative

QC Narrative



All analyses met EAS method criteria as defined in the Quality Manual, except as noted in the report or QC reports with data qualifiers.

Subcontract Narrative

No sample analysis was subcontracted for this project

Laboratory Certification

I certify that this data package is in compliance with the terms and conditions of the contract, both technically and for completeness other than the condition(s) noted above. The Laboratory Report is property of EAS and its client. The entire report has been reviewed and approved.

Date Approved: 9/3/2026

Naphthalene
1,2,3-Trichlorobenzene
Hexachlorobutadiene
1,1-Difluoroethane

Quality Control Report

EAS SDG Number: 226144

Project Number: 17807

QC Narrative

Samples were anlayzed in a daily analytical batch (DAB) designated by a QC batch number, and were analyzed using EAS standard laboratory QC specified in the EAS Quality Manual which may be different then the referrenced agency method. Any deviations from the EAS QC criteria are flagged in the Laboratory Control Reports or in the sample Analytical Reports.

Standard Laboratory QC Report

Unless project specific QC was requested, this Section containing the standard laboratory QC (Level 2) supplied with the Analytical Reports. Each sample is analyzed in a Daily Analytical Batch (DAB) which includes the method blank, a laboratory control spike (LCS) and a laboratory control duplicate (LCD). A Daily Analytical Batch QC report is supplied for each method requested.

Method Blank

The method blank is a laboratory generated sample which assesses the degree to which laboratory operations cause a false positive. The target analytes in the analytical reports for a daily analytical batch are "B" flagged if their concentrations are present in the Method Blank above the RL, unless the result is greater then ten times the blank value..

Laboratory Control Spike

A laboratory control spike is a well characterized matrix similar to the sample which is spiked and run in duplicate with each Daily Analytical Batch. The laboratory control spike results are reported as a percent recovery. The QC Criteria for the control spike is listed in the Laboratory Control Report. Any results outside the control limits are flagged with a "Q" on the Laboratory Control Report. The control spike contains an abbreviated list of compounds in the method, and may contain compounds not on the target list for the specified report.

Laboratory Control Duplicate

The laboratory control duplicate is a duplicate analysis of the laboratory control spike, a standard, or a sample depending on the method. The results are reported as a relative percent difference (RPD). The criteria for the duplicate is in the Laboratory Control Report for the Daily Analytical Batch. Any results outside the control limits are flagged with a "Q" on the Laboratory Control Report.

Analytical Reports

EAS SDG Number: 226144

Project Number: 17807

The following pages contain the certified Analytical Reports for the samples submitted in the Sample Delivery Group (SDG) and are in order of the EAS Lab ID number. All of the analytical methods used are modifications of the published methods. Procedural method modifications, QC modifications, QC Criteria modifications, target lists, definitions of detection limits, and flags are all explained in detail in the EAS Quality Manual. The Analytical Report has columns for the method detection limit (MDL), the reporting limit (RL), and the Amount. The Amount is the concentration of the compound in the sample. The report usually has the results reported with two commonly used units. The MDL, RL, and Amount are adjusted for the canister dilution factor and any dilution caused by sample matrix effects.

NELAC CERTIFICATION

EAS is accredited by the National Environmental Laboratory Accreditation (NELAC) with the Florida Department of Health, one of the NELAC certifying states. EAS is certified for the EPA TO-15, EPA TO-11 and EPA TO-4 methods. A list of accredited compounds is available on request.

DETECTION LIMITS

MDL: The MDL is lowest concentration that can be measured to be statistically above the noise level and is determined using the EPA 2016 method which uses the standard deviation of replicate measurements made over time. The method also incorporates systematic instrumentation blank levels. See Quality Manual for detailed explanation.

RL: The reporting limit (RL) is the lowest concentration that can be reliably reported for each compound that meets the QC Criteria for the method, background levels, or project specific considerations. The QC criteria level for the method blank is to be less then the RL See Quality Manual for more information.

DATA FLAGS

In the standard report, if a compound is not detected above the method detection limit, a "ND" is in the Amount column. The flag column is used for both the not detect flag and for any data flags.

B - This compound was detected in the batch method blank above the reporting limit and is greater then one tenth the amount in the sample.

E - This compound exceeds the calibration range for this sample volume.

J - The amount reported is estimated because it was below the RL and could be below the lowest calibration point, have higher uncertainty, or could be the result of system background

SIGNIFICANT FIGURES

Based on the uncertainty in the methods, the numbers on the Analytical Reports should be used with only two significant digits. Additional significant figures are reported for ease of use and to avoid rounding errors when used in further calculations.

UNITS

PPBV or PPMV: Parts-per-billion (or million) by volume is a mole (volume) ratio of the moles of analyte divided by the moles of air (gas). This is the primary unit used to report air or gas concentrations and is independent of temperature and pressure.

UG/M3 OR MG/M3: The reported result was calculated based on 1 atm pressure and a temperature of 25C. The conversion from PPBV is: UG/M3 = PPBV x MW/24.46 where 24.26 is the gas constant and MW is the Compounds Molecular Weight (sometimes called Formula Weight)

Analytical Report

Project Name:

Chiquita Canyon

EAS SDG Number: **226144**

Client Project Manager: Chuck Schmidt

Prepared For:
C.E. Schmidt
19200 Live Oak Road
Red Bluff CA 96080

Project Number: 17807
Sample Event Date: 7/20-7/24/2026
Received Date: 7/24/2026
Report Date: 9/10/2026

Project Number: ASTM D1945 PG
PO Number:

This is the Laboratory Report for the samples in the indicated Sample Delivery Group (SDG). Each sample received in the group is assigned a Laboratory ID number. The combination of the SDG number and the Lab ID number is an unique identifier for the sample.

This Report Contains:

Laboratory Work Order
Project Sample Media
Laboratory Case Narrative and Chain of Custody
Method Description (when applicable)
Quality Control Reports
Analytical Reports

NELAC Certification: Florida E871125

173 Cross Street, San Luis Obispo, CA 93401 (805) 781-3585

Laboratory Work Order

SDG Number: 226144

T-313	226144 41	ASTM D3416 Low Level Methane	7/22/2026

Client Sample ID	EAS Lab No.	Analysis Requested	Date Sampled
T-313	226144 41	EPA TO-12 C2 to C12 CRYO	7/22/2026
T-313	226144 41	EPA TO-15 Full List 95 + 1,1 DFA,Acrolein + TIC 1	7/22/2026
T-314	226144 42	ASTM D1945 Permanent Gas Analysis	7/22/2026
T-314	226144 42	EPA TO-15 Full List 95 + 1,1 DFA,Acrolein + TIC 1	7/22/2026
T-314	226144 42	ASTM D3416 Low Level Methane	7/22/2026
T-314	226144 42	ASTM D1945 Hydrogen Confirmation	7/22/2026
T-314	226144 42	EPA TO-12 C2 to C12 CRYO	7/22/2026
T-401	226144 43	ASTM D1945 Hydrogen Confirmation	7/23/2026
T-401	226144 43	ASTM D1945 Permanent Gas Analysis	7/23/2026
T-401	226144 43	ASTM D3416 Low Level Methane	7/23/2026
T-401	226144 43	EPA TO-12 C2 to C12 CRYO	7/23/2026
T-401	226144 43	EPA TO-15 Full List 95 + 1,1 DFA,Acrolein + TIC 1	7/23/2026
T-402	226144 44	EPA TO-12 C2 to C12 CRYO	7/23/2026
T-402	226144 44	ASTM D3416 Low Level Methane	7/23/2026
T-402	226144 44	ASTM D1945 Permanent Gas Analysis	7/23/2026
T-402	226144 44	ASTM D1945 Hydrogen Confirmation	7/23/2026
T-402	226144 44	EPA TO-15 Full List 95 + 1,1 DFA,Acrolein + TIC 1	7/23/2026
T-403	226144 45	ASTM D1945 Hydrogen Confirmation	7/23/2026
T-403	226144 45	ASTM D1945 Permanent Gas Analysis	7/23/2026
T-403	226144 45	ASTM D3416 Low Level Methane	7/23/2026
T-403	226144 45	EPA TO-12 C2 to C12 CRYO	7/23/2026
T-403	226144 45	EPA TO-15 Full List 95 + 1,1 DFA,Acrolein + TIC 1	7/23/2026
T-404	226144 46	ASTM D1945 Permanent Gas Analysis	7/23/2026
T-404	226144 46	EPA TO-15 Full List 95 + 1,1 DFA,Acrolein + TIC 1	7/23/2026
T-404	226144 46	ASTM D3416 Low Level Methane	7/23/2026
T-404	226144 46	ASTM D1945 Hydrogen Confirmation	7/23/2026
T-404	226144 46	EPA TO-12 C2 to C12 CRYO	7/23/2026
T-405	226144 47	ASTM D1945 Hydrogen Confirmation	7/23/2026
T-405	226144 47	ASTM D1945 Permanent Gas Analysis	7/23/2026
T-405	226144 47	ASTM D3416 Low Level Methane	7/23/2026

Client Sample ID	EAS Lab No.	Analysis Requested	Date Sampled
T-405	226144 47	EPA TO-12 C2 to C12 CRYO	7/23/2026
T-405	226144 47	EPA TO-15 Full List 95 + 1,1 DFA,Acrolein + TIC 1	7/23/2026
T-406	226144 48	EPA TO-15 Full List 95 + 1,1 DFA,Acrolein + TIC 1	7/23/2026
T-406	226144 48	EPA TO-12 C2 to C12 CRYO	7/23/2026
T-406	226144 48	ASTM D1945 Permanent Gas Analysis	7/23/2026
T-406	226144 48	ASTM D1945 Hydrogen Confirmation	7/23/2026
T-406	226144 48	ASTM D3416 Low Level Methane	7/23/2026
T-407	226144 49	ASTM D1945 Hydrogen Confirmation	7/23/2026
T-407	226144 49	ASTM D1945 Permanent Gas Analysis	7/23/2026
T-407	226144 49	ASTM D3416 Low Level Methane	7/23/2026
T-407	226144 49	EPA TO-12 C2 to C12 CRYO	7/23/2026
T-407	226144 49	EPA TO-15 Full List 95 + 1,1 DFA,Acrolein + TIC 1	7/23/2026
T-408	226144 50	EPA TO-12 C2 to C12 CRYO	7/23/2026
T-408	226144 50	EPA TO-15 Full List 95 + 1,1 DFA,Acrolein + TIC 1	7/23/2026
T-408	226144 50	ASTM D3416 Low Level Methane	7/23/2026
T-408	226144 50	ASTM D1945 Permanent Gas Analysis	7/23/2026
T-408	226144 50	ASTM D1945 Hydrogen Confirmation	7/23/2026
T-409	226144 51	ASTM D1945 Permanent Gas Analysis	7/23/2026
T-409	226144 51	ASTM D3416 Low Level Methane	7/23/2026
T-409	226144 51	EPA TO-12 C2 to C12 CRYO	7/23/2026
T-409	226144 51	EPA TO-15 Full List 95 + 1,1 DFA,Acrolein + TIC 1	7/23/2026
T-409	226144 51	ASTM D1945 Hydrogen Confirmation	7/23/2026
T-410	226144 52	ASTM D1945 Hydrogen Confirmation	7/23/2026
T-410	226144 52	ASTM D1945 Permanent Gas Analysis	7/23/2026
T-410	226144 52	ASTM D3416 Low Level Methane	7/23/2026
